

# Lake Louise and Aspen Winter Conferences 2018

PPD seminar  
23<sup>rd</sup> May 2018  
Fergus Wilson

# Outline

- Holiday snaps
- SUSY (ATLAS/CMS)
- Long Lived Particles
- Dark Photons
- $g-2$
- Dark Matter
- Flavour - Neutrinos
- Flavour – Leptons and quarks
- Gravitational Waves

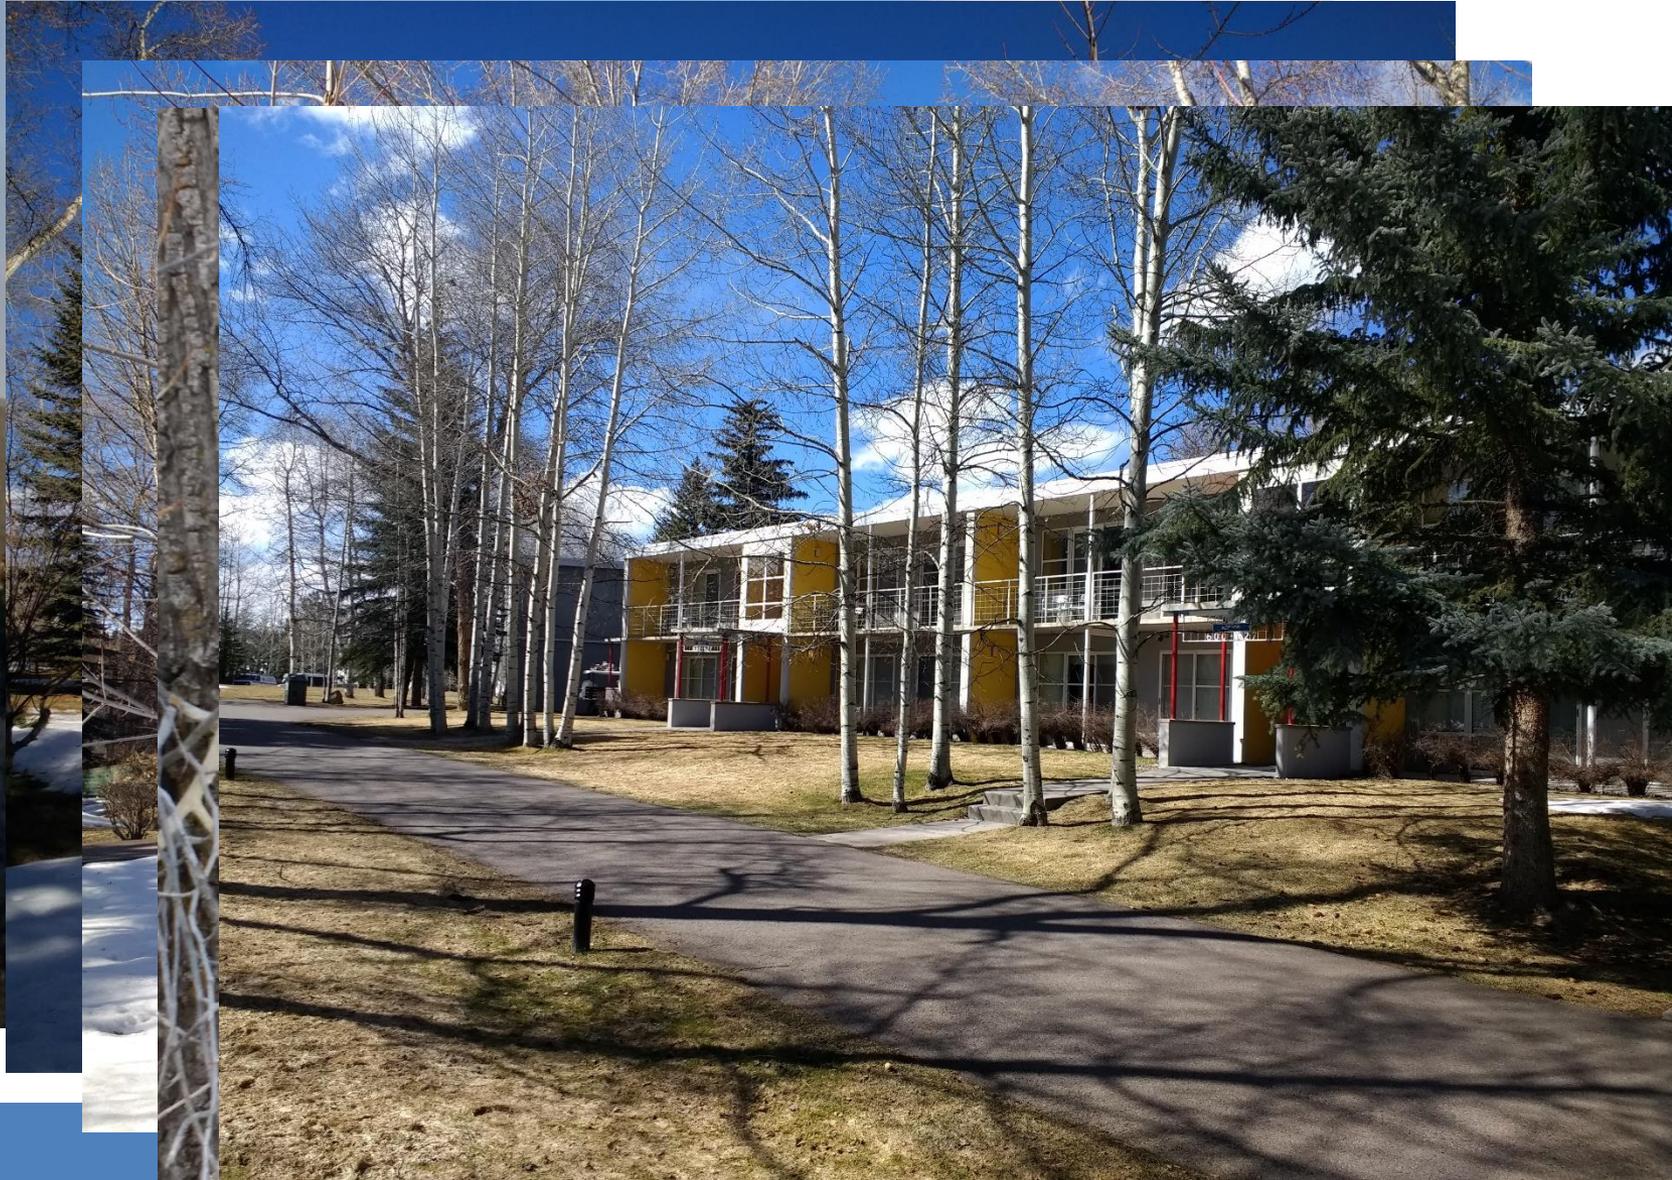

# Lake Louise (Canada) and Aspen (USA)

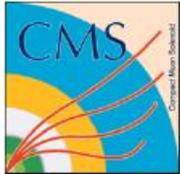

# Lake Louise, Alberta

# Aspen, Colorado

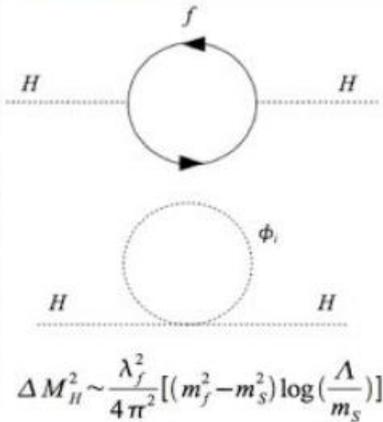

**SUSY**

## Three Miracles of SUSY

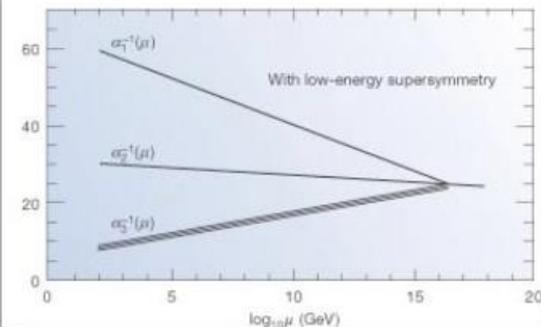

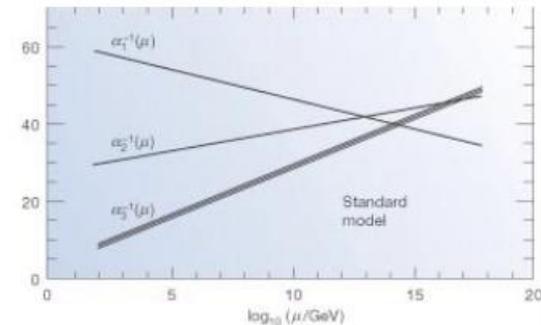

Greg Landsberg - SUSY Searches at CMS - Corfu 2017

Slide 6

◆ Elegant solution to the hierarchy problem (i.e., why the Higgs boson mass is not found at the Planck scale)

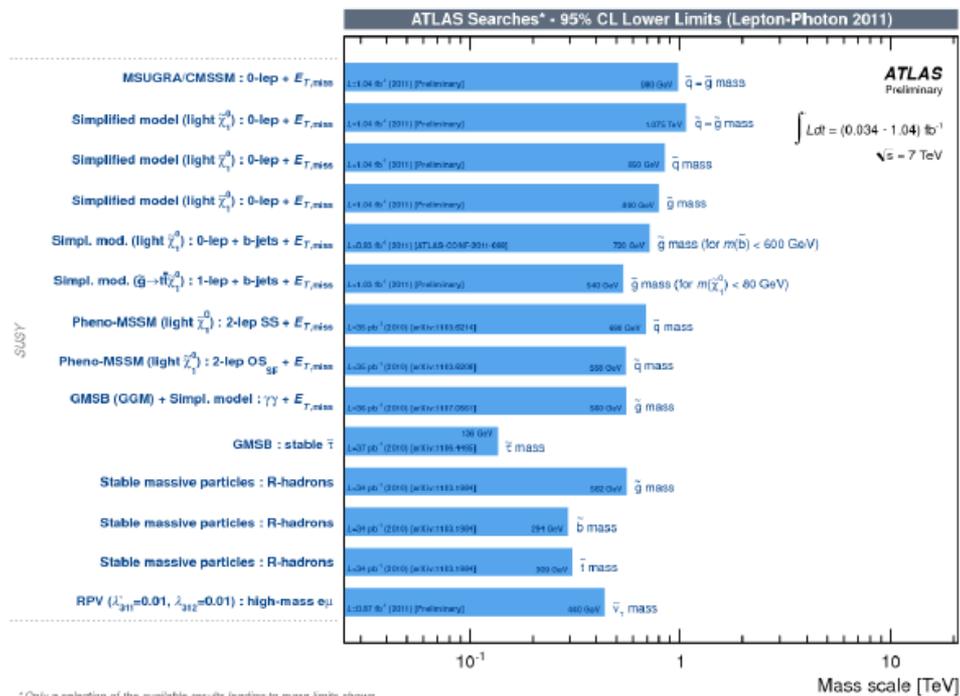

◆ Gauge unification

◆ Dark matter candidate with the right abundance

## ATLAS searches pre-Higgs (2011)

- The majority of searches were inclusive. They targeted strongly-produced SUSY particles that cascade decay to WIMPS (DM candidates) and generic models like MSUGRA/MSSM/GMSB.
- Searches for the 3<sup>rd</sup> generation were emerging (e.g. arXiv:1101.1963)

## Contemporary search program

- The 125 GeV Higgs is considered as “SUSY model killer” (tension with high-scale theories). However, the discovery of Higgs inspired a number of searches for  $m \sim O(1 \text{ TeV})$  3<sup>rd</sup> generation squarks.
- Overall, the search program is more exciting than ever before.
- Goes even beyond the R-parity conserving models and in the corners of phase space where the mass differences are small (compressed and long-lived).
- Caveat: The data are often interpreted for simplified models so the limits need to be translated carefully for your model of choice.
  - The simplified models may give overly high or low exclusion.

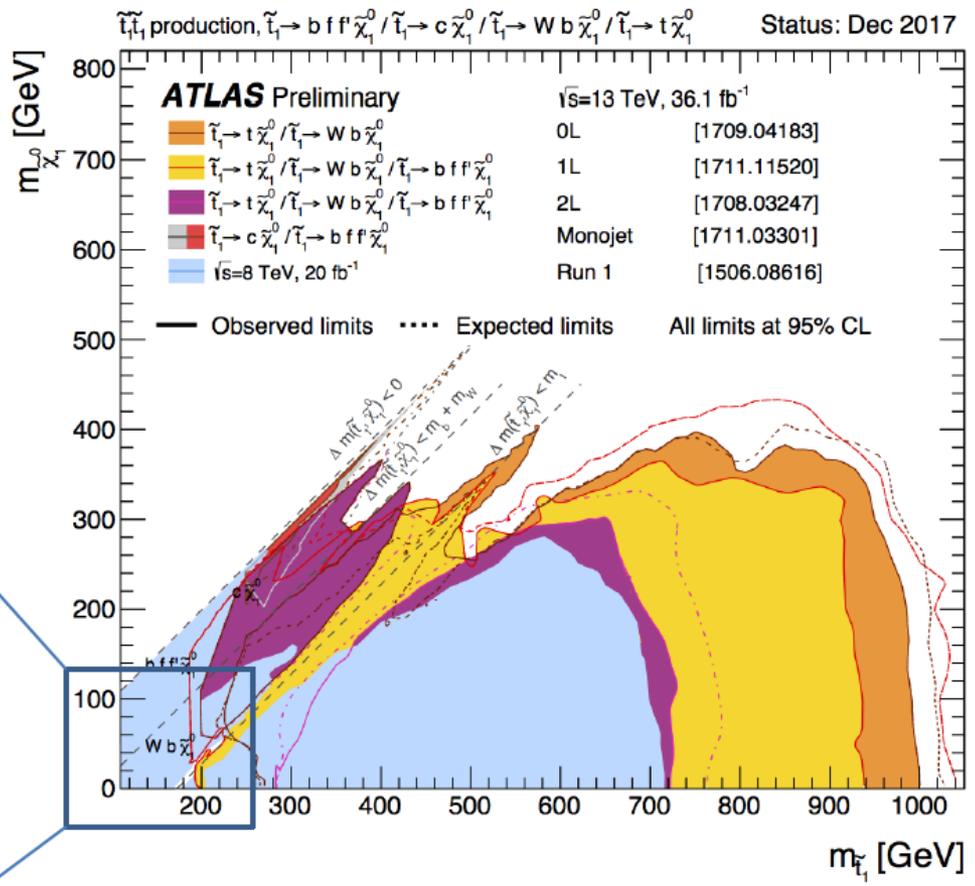

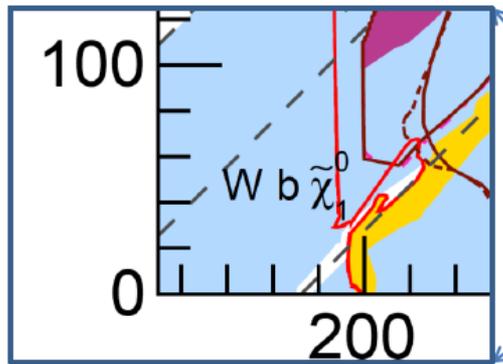

Hidetoshi will discuss this later on.

## Direct stop pair-production: Overview

- Huge improvement in sensitivity in comparison to Run 1
- Decays with neutralinos heavier than 300-400 GeV are difficult to probe.
- What is happening with  $m(\text{stop}) \sim 220$  GeV and  $m(\text{LSP}) \sim 50$  GeV?

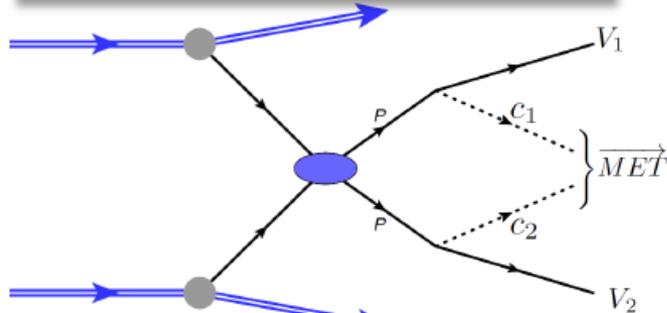

# The $M_{T2}$ Variable

Greg Landsberg - SUSY Searches at CMS - Corfu 2017

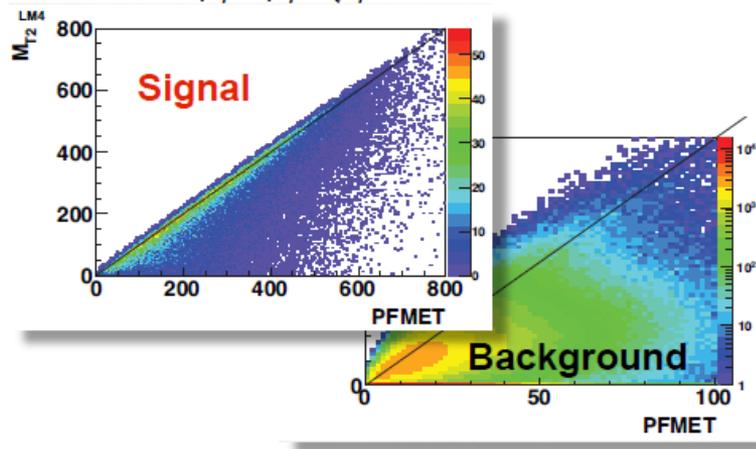

Slide 11

- ◆  $M_{T2}$ : “*transverse mass*” - a generalization of the transverse mass in case of a pair of invisible particles
- ◆ For a simplified case of no extra jets and zero masses for visible and invisible systems:
  - $(M_{T2})^2 \simeq 2p_T^{vis(1)} p_T^{vis(2)} (1 + \cos\phi_{12})$
  - $M_{T2} \sim M_{ET}$  for symmetric SUSY-like topologies
- ◆  $M_{T2}$  kills QCD background very efficiently:
  - $M_{T2} \sim 0$  for dijets
  - $M_{T2} < M_{ET}$  in case of mismeasured dijets

Lesters & Summers, hep-ph/9906349

$$M_{T2} = \min_{p_T^{c1} + p_T^{c2} = \cancel{p}_T} \left[ \max \left( m_T^{(1)}, m_T^{(2)} \right) \right]$$

# LONG LIVED PARTICLES

## Physics behind long-lived particles

Caveat : These are just examples.

### SUSY

- Long-lived  $\tilde{g}$  : Heavy squark,  $\tilde{g}$ -Bino co-annihilation
- Long-lived  $\tilde{\chi}^\pm$  : Wino/Higgsino Lightest Stable Particle (LSP)
- Long-lived  $\tilde{\chi}^0$  : Gravitino LSP, R-parity violation, Wino-Bino co-annihilation

### Hidden/dark sector scenario

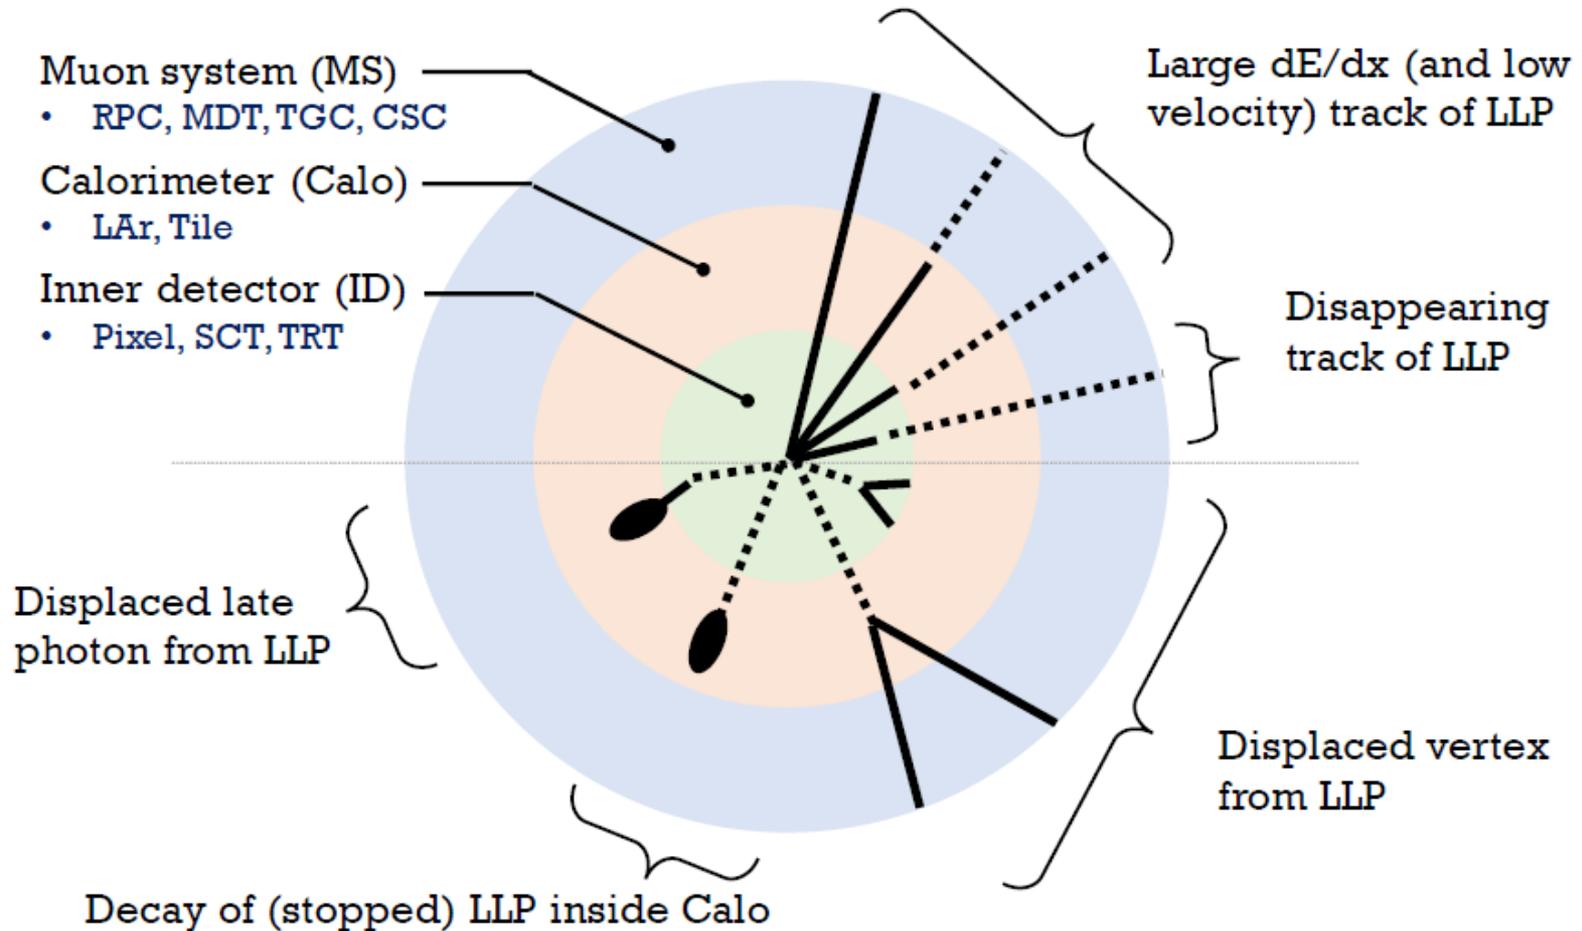

- Long-lived dark photon : Higgs portal model
- Long-lived neutral scalar : Heavy neutral boson portal model

### Others

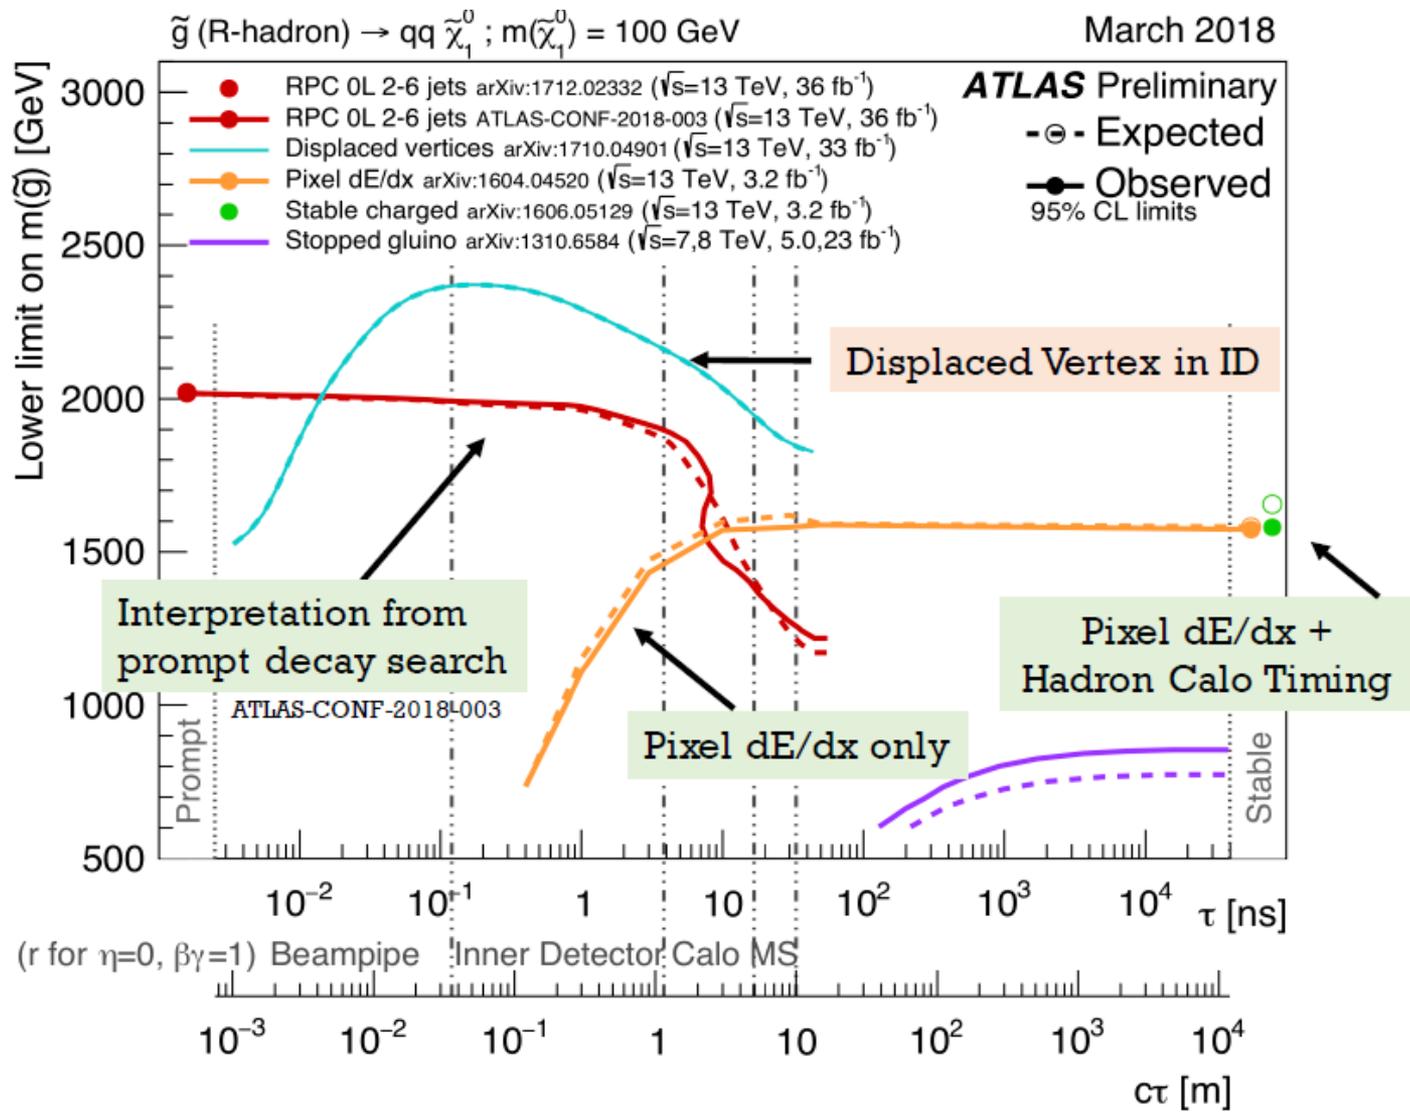

- Long-lived right-handed neutrino : Left-right symmetry extension of SM
- Long-lived multi-charged particle : Monopole, Micro black hole, Q-ball

**And many more !!**

## Signatures of long-lived particles

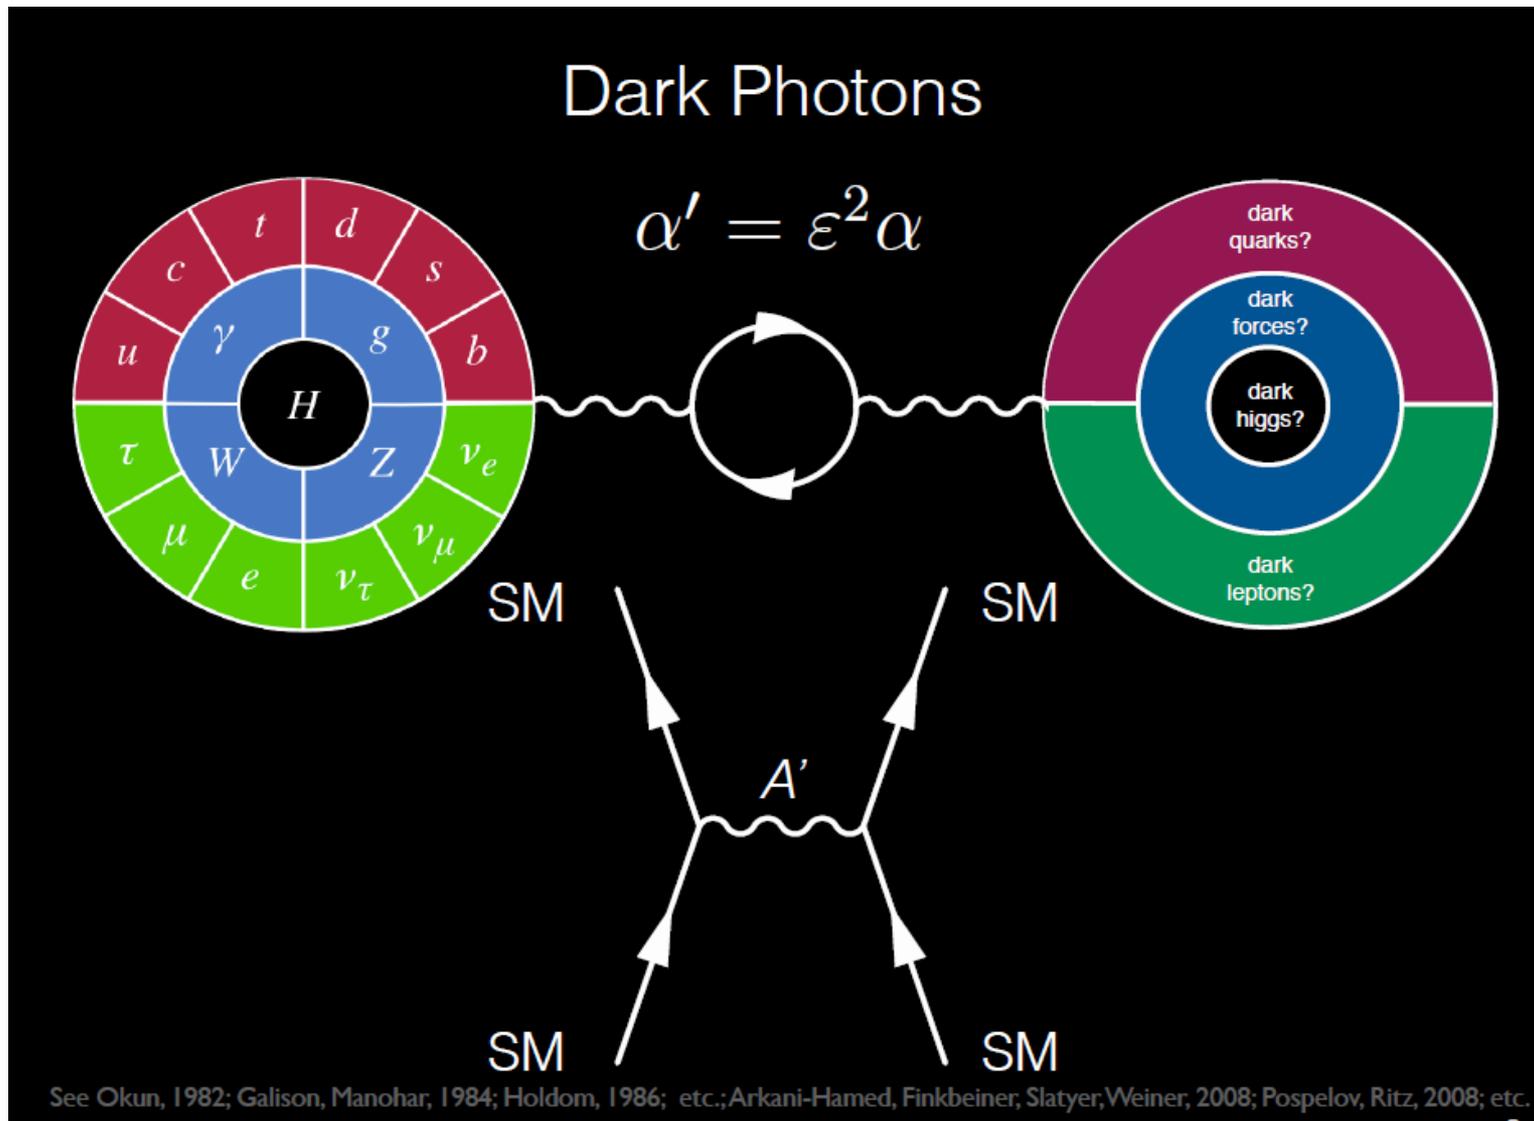

# Long Lived Particles

# DARK/HIDDEN SECTOR

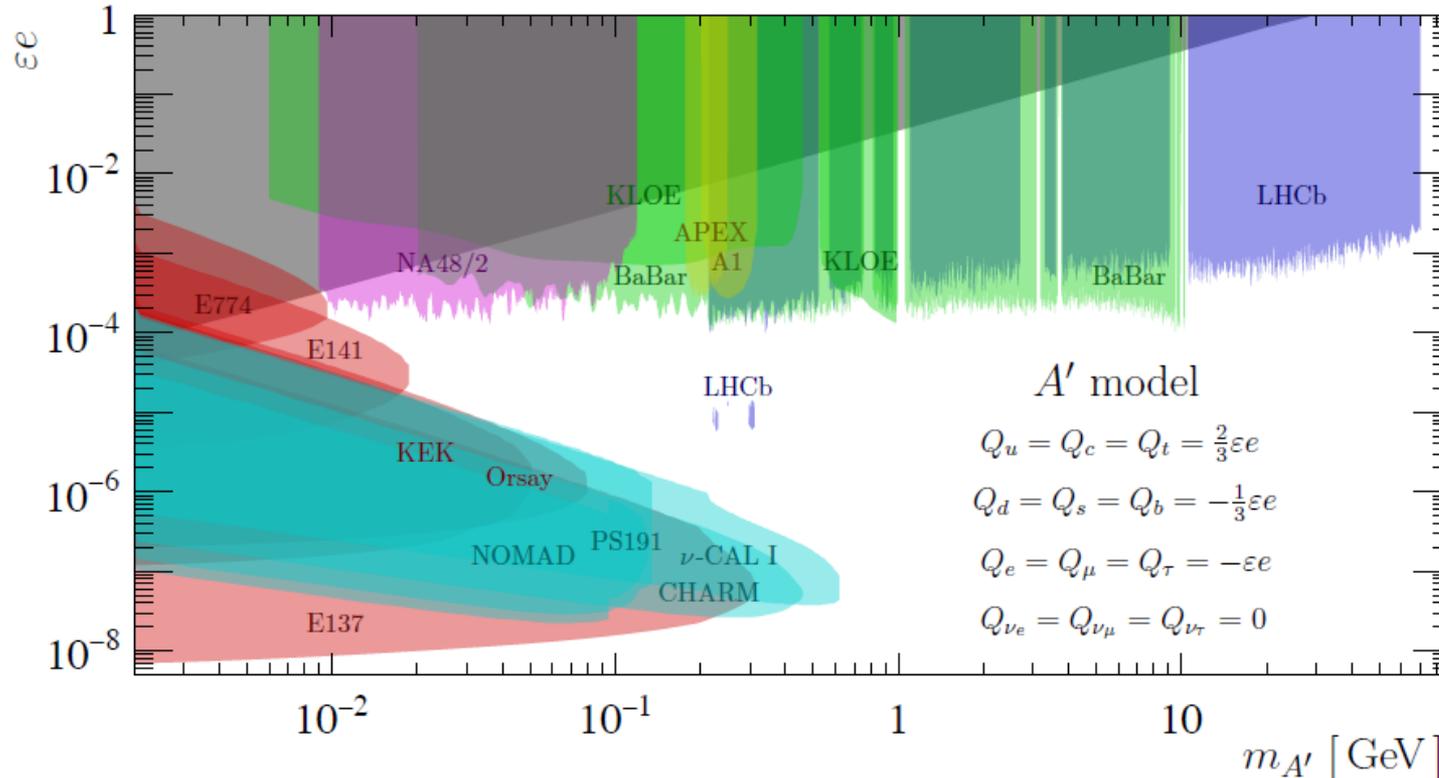

# Dark Sector

## Recasting for other Models

Dark photon searches provide sensitivity to (many) other models.

Ilten, Soreq, MW, Xue [1801.04847]

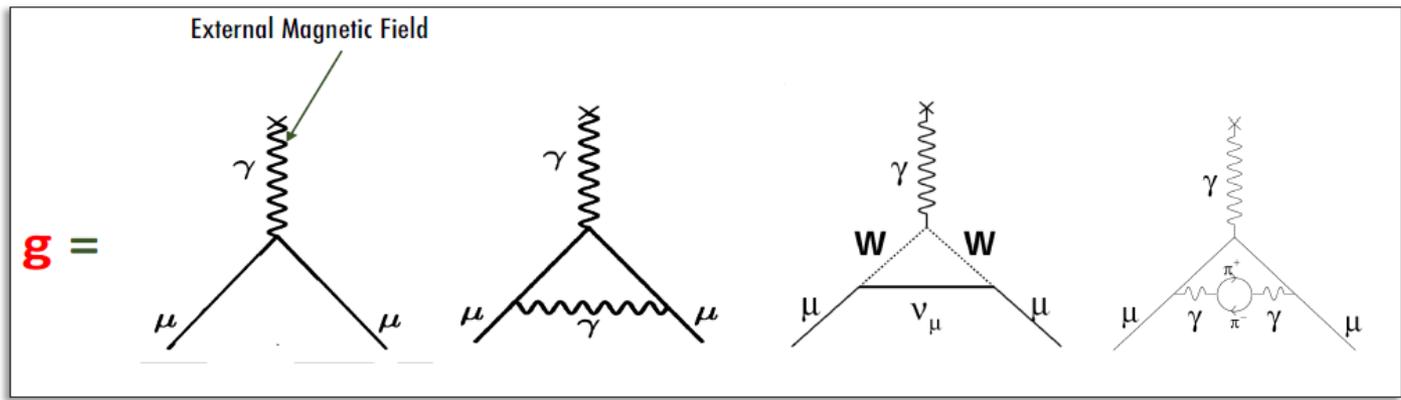

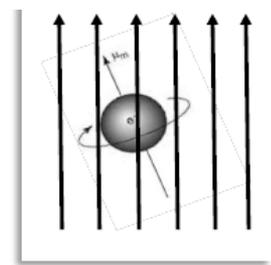

We developed a data-driven way to easily recast any dark photon search to obtain limits on any other vector model (auto-calculates hadronic decay rates for all masses).

14

**G-2**

$\vec{\mu}$  = magnetic moment  
 $\vec{S}$  = spin  
 $g$  = g-factor  
 $q$  = charge  
 $m$  = mass

$$\vec{\mu} = g \frac{q}{2m} \vec{S}$$

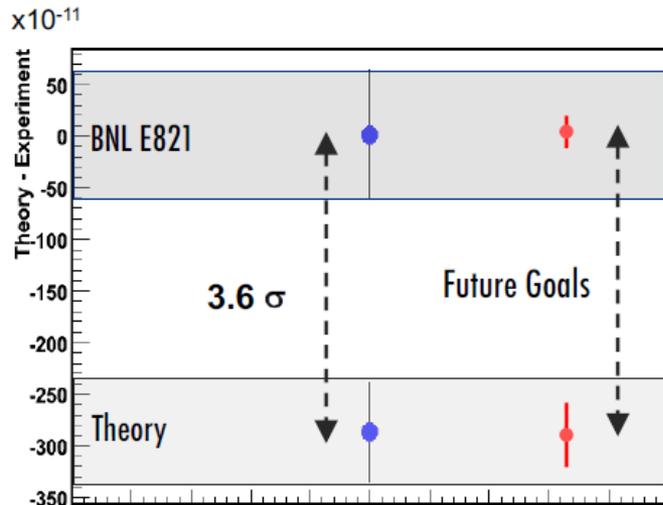

$$g = 2(1 + a)$$

$$a_{\mu}^{SM} = (g - 2) / 2 = a^{QED} + a^{EW} + a^{QCD}$$

muon anomalous magnetic moment

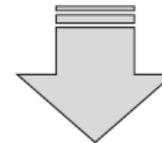

$> 7 \sigma$  for unchanged central values

**New Physics!**

Uncertainty Source $\delta a_\mu$	Status 2015 [ppb]	Projected after FNAL [ppb]
Total Theory	420	310
HVP	360	215
HLbL	225	225
Total Exp.	540	140

Theory uncertainty remains the same, both the theoretical and experimental central values are unchanged, but the experimental uncertainty is reduced.

**5  $\sigma$  discrepancy**

## Outline

- Muon g-2 Physics
- Muon g-2 Experiment
- Muon g-2 Status
- Conclusions

BNL experiment was statistically limited.

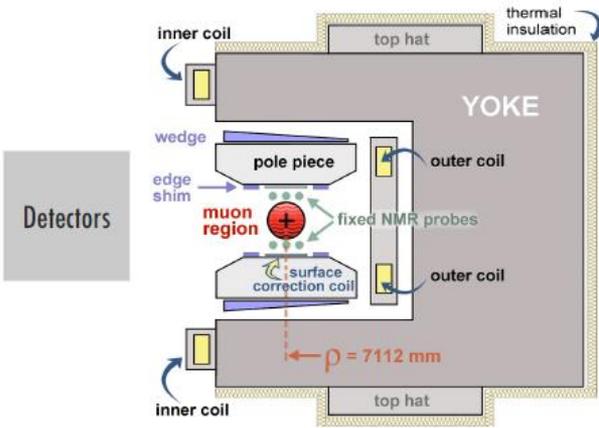

Need more muons!

Lets move to Fermilab!

Reduce the 480 ppb statistical uncertainty to 100 ppb! → 10 x BNL data

Magnetic Field = 1.4513 T  
 Current = 5176 A  
 3 x 15 m  
 700 tons  
 12 Yokes: C shaped flux

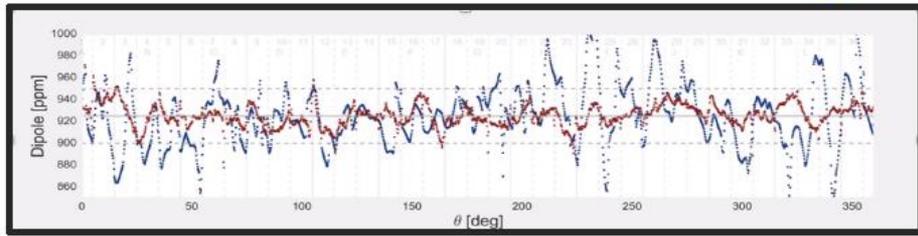

$$a_{\mu}(\text{Expt}) = \frac{g_e \omega_a m_{\mu} \mu_p}{2 \tilde{\omega}_p m_e \mu_e}$$

# DARK MATTER

## The Dark Matter Landscape

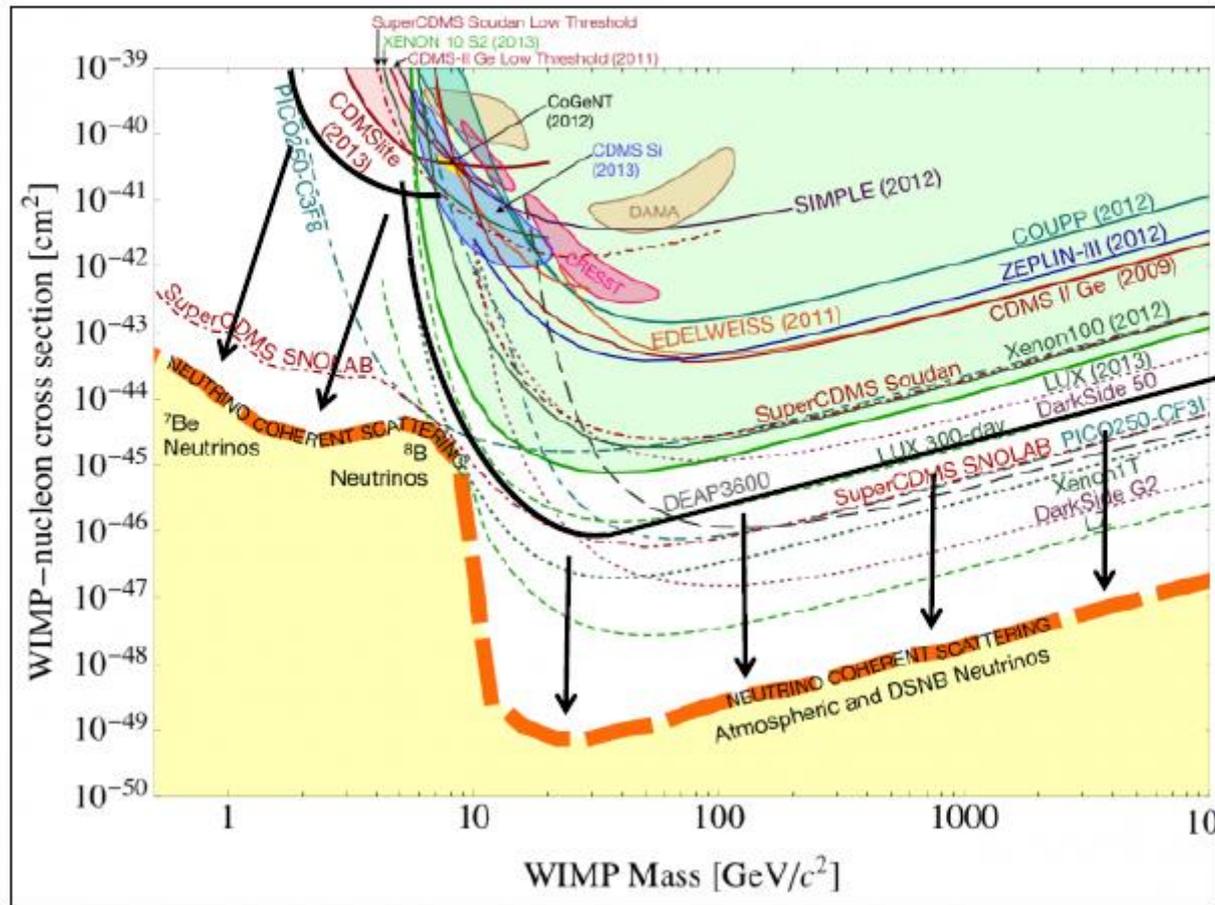

# Dark Matter

## Recent Results From XENON1T, PandaX-II, CRESST-III

## The Future of Direct Detection

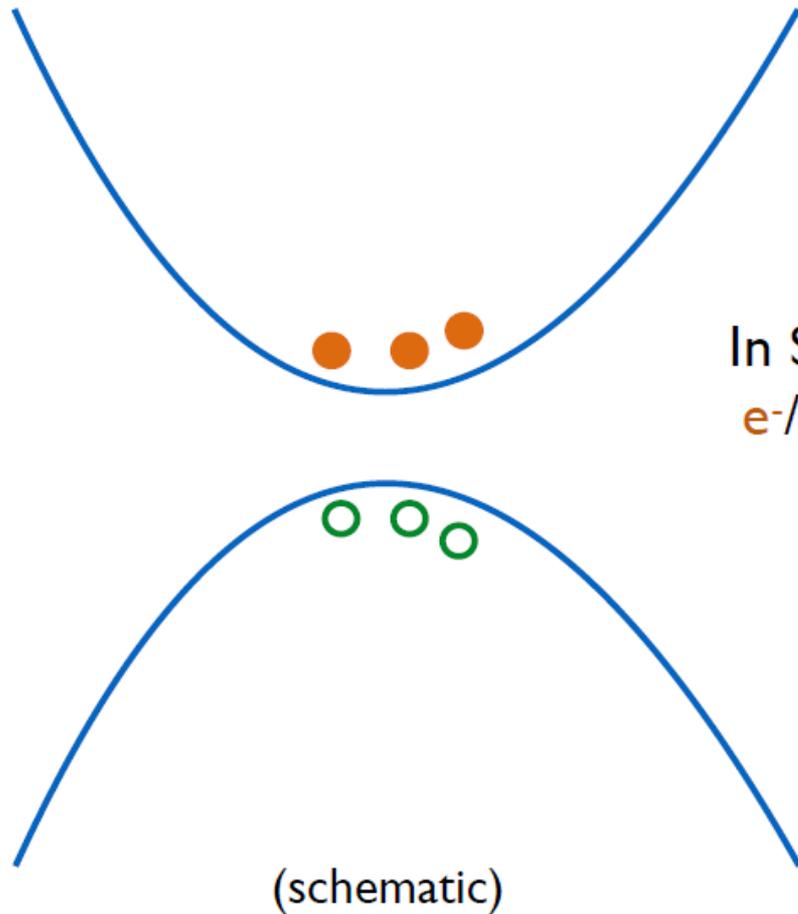

## An (Incomplete) List of Ways to Reconcile WIMP Dark Matter With All Current Constraints:

- 1) Co-annihilations between the dark matter and another state
- 2) Annihilations to W, Z and/or Higgs bosons; scattering with nuclei only through highly suppressed loop diagrams
- 3) Interaction which suppress elastic scattering with nuclei by powers of velocity or momentum
- 4) Dark matter that is lighter than a few GeV (evading direct constraints)
- 5) Departures from radiation domination in the early universe (early matter domination; late-time reheating, etc.) which result in the depletion of the dark matter's relic abundance
- 6) The dark matter annihilates to unstable non-Standard Model states (*ie.* hidden sector models)

***Although potentially invisible to both underground detectors and colliders, many of these scenarios are testable with indirect searches  
In this sense, the lack of such signals has strengthened the motivation for gamma ray, cosmic ray and neutrino searches for dark matter***

## A dark matter event in silicon

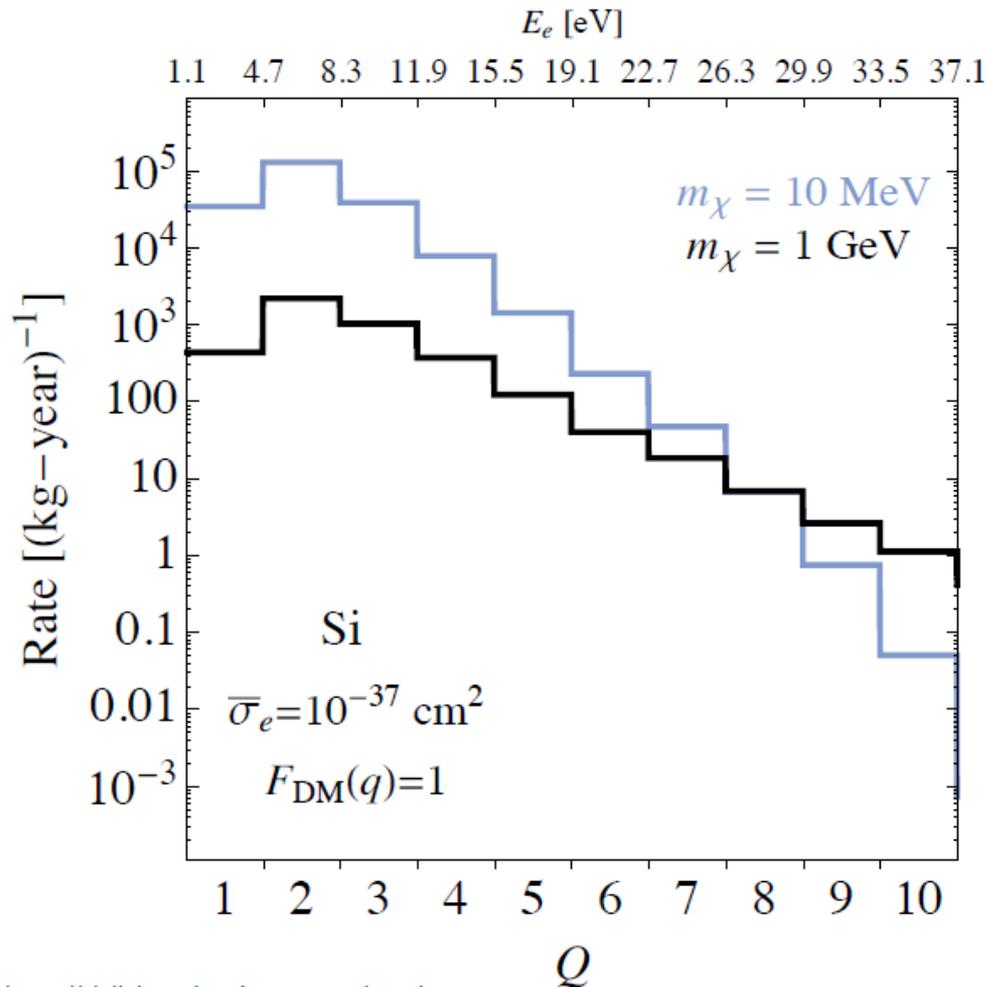

In Si, create one additional  $e^-/h^+$  pair for each 3.6 eV of recoil energy

here  $Q = 3$

D

## Rates increase dramatically for lower $Q$

RE, Fernandez-Serra, Mardon, Soto, Volansky, Y

Best threshold  
for a Si detector  
before June 2017:  
 $\sim 11e^-$  (40 eV)

A recent  
technological  
breakthrough  
enables much  
lower thresholds:  
**SENSEI**

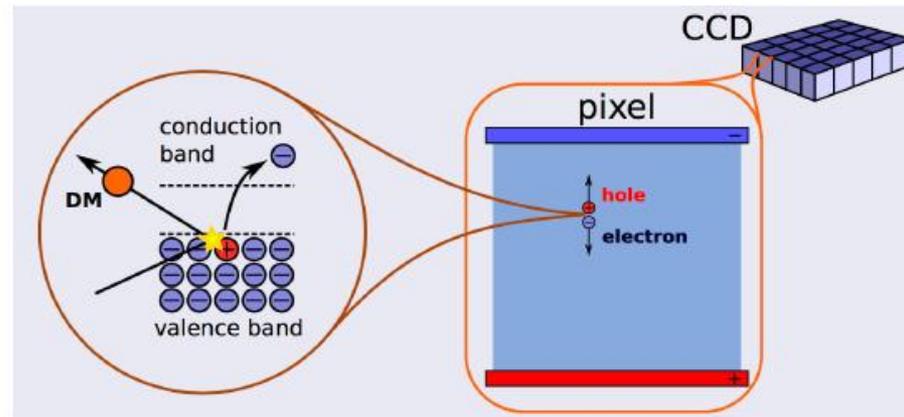

# SENSEI detector

SENSEI's target material are  
special silicon CCDs

~million pixels

“Skipper CCDs”

## Skipper CCD

- has a modified readout stage that allows multiple sampling of the same pixel without corrupting the charge packet:

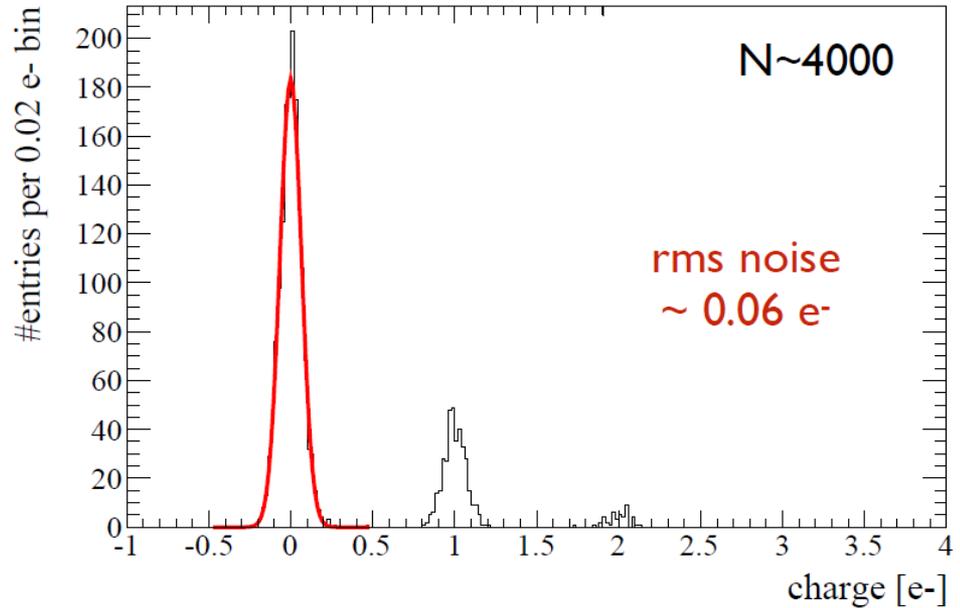

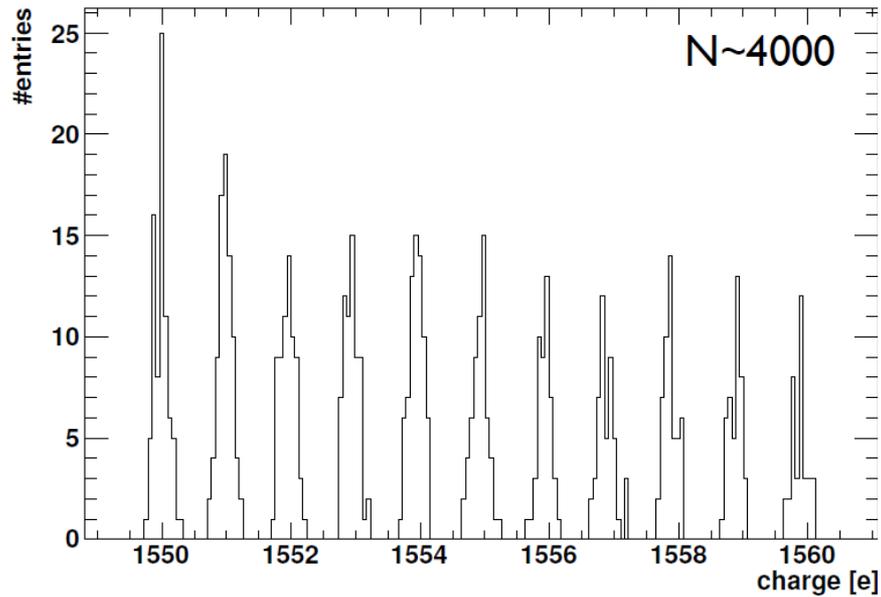

$$\text{pixel value} = \frac{1}{N} \sum_i^N (\text{pixel sample})_i$$

- developed in collaboration with LBNL MicroSystems Lab
- successfully demonstrated in a Fermilab LDRD project (2016)

Tiffenberg, Sofu-Haro, Drlica-Wagner, RE, Guardincerri, Holland, Volansky, Yu (1706.00028, PRL)

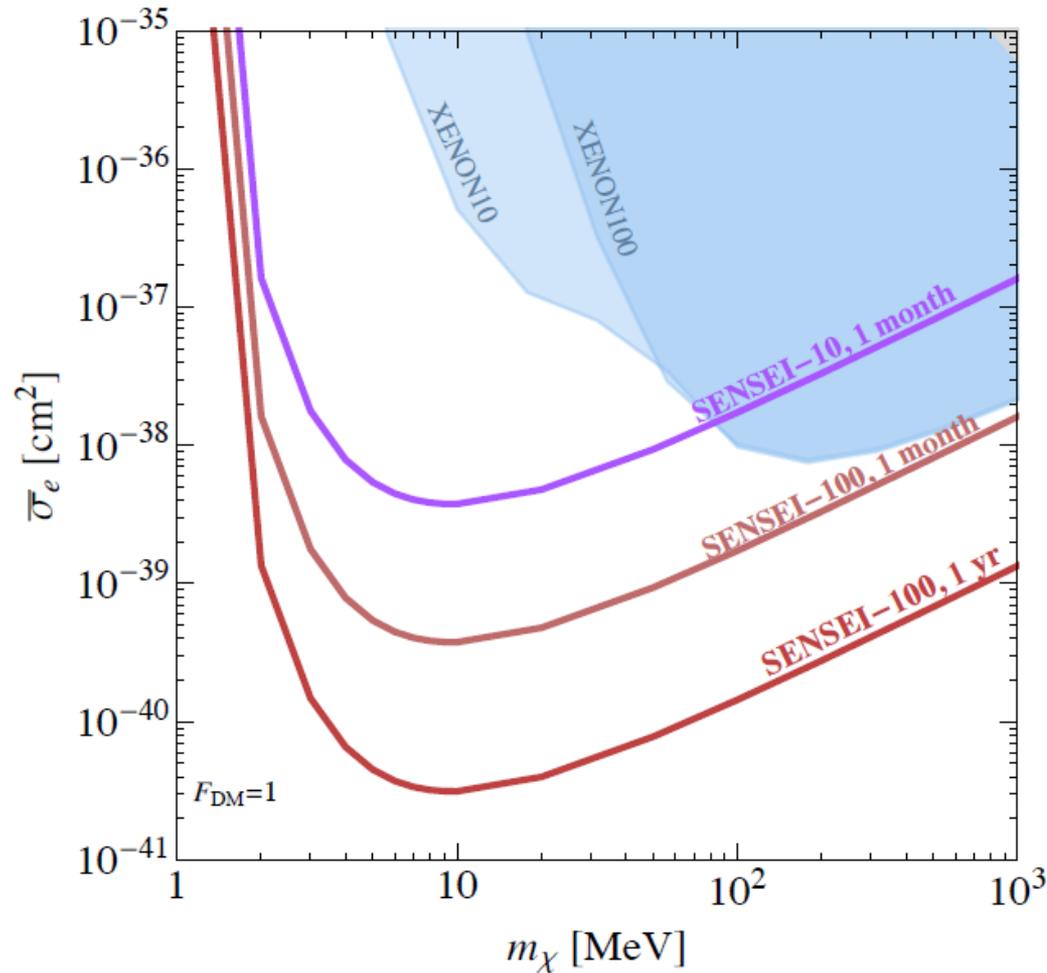

Achieved rms noise  $\sim 0.06 e^- \implies$  Dramatic reduction in threshold!

## Counting Electrons

Tiffenberg, Sofo-Haro, Drlica-Wagner, RE, Guardincerri, Holland, Volansky, Yu (1706.00028, I

## SENSEI projections

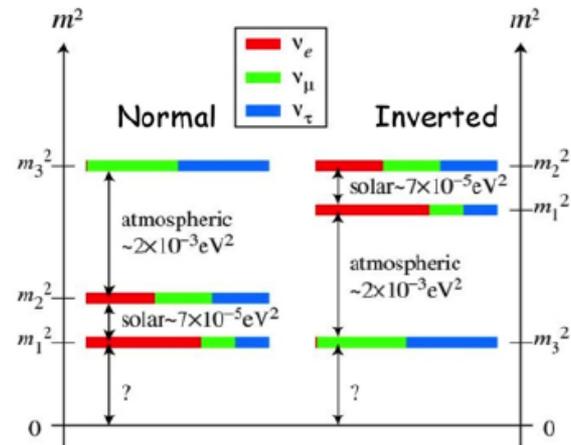

heavy mediator

# NEUTRINOS

## Still many profound unknowns

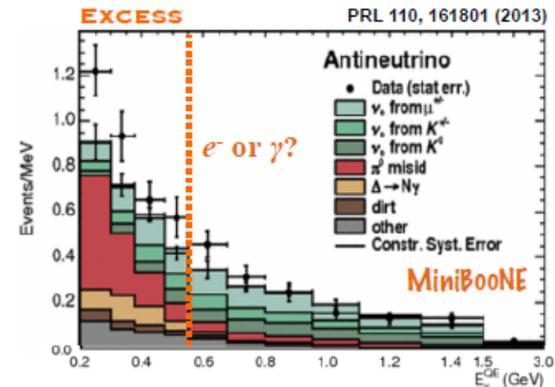

- Are there more than 3 neutrino flavors?
  - do light sterile neutrinos exist?
- Is CP violated in the leptonic sector?
  - understanding matter - anti-matter asymmetry?
- What is the Neutrino mass hierarchy?
  - which neutrino is the lightest?

Several anomalies that don't fit in the 3 oscillation scenario:  
A New Neutrino?

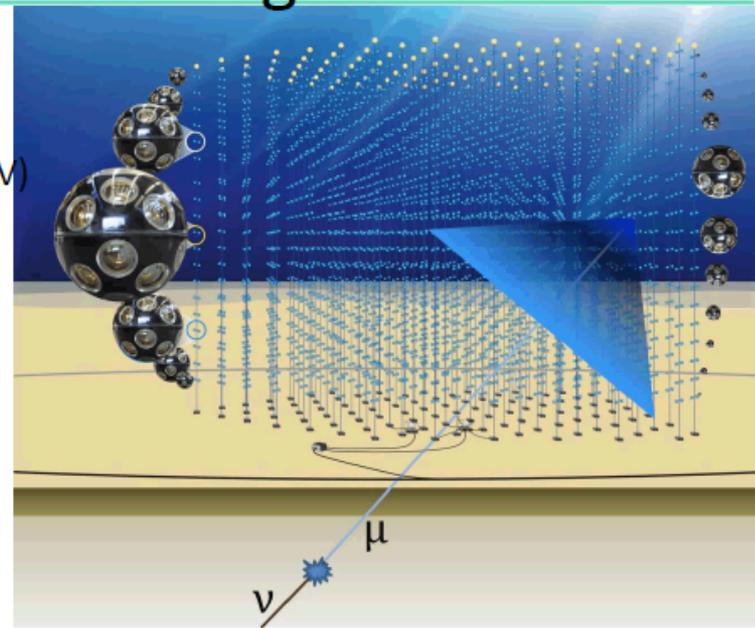

Experiment	Type	Channel	Significance
LSND	DAR	$\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ CC	$3.8\sigma$
MiniBooNE	SBL accelerator	$\nu_\mu \rightarrow \nu_e$ CC	$3.4\sigma$
MiniBooNE	SBL accelerator	$\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ CC	$2.8\sigma$

arXiv:1204.5379 (2012)

## KM3NeT detector design

- Detection principle Optical Cherenkov radiation
- 6 orders of magnitude in energy (GeV-PeV)
- All flavour detection
- A 3D array built with a modular design
- **Optical sensor: multi-PMT (DOM)**
- **Detection units (DU): vertical slender strings host 18 DOMs**
- **Building blocks of 115 DUs each**
- Power and data distributed by a single backbone cable with breakouts at DOMs
- Sea network of submarine cables and Junction Boxes connected to shore via a main e/o cable
- All data to shore

	ARCA	ORCA
Location	Italy	France
DU distance	90m	20m
DOM spacing	36m	9m
Instrumented mass	2*500Mton	5.7 Mton

## KM3NeT DOM and DU

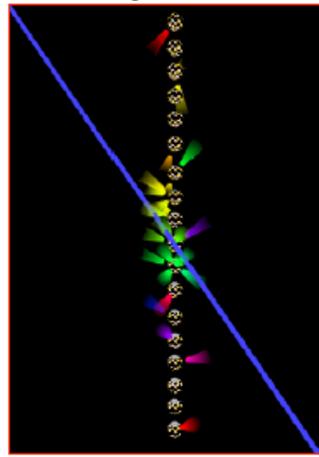

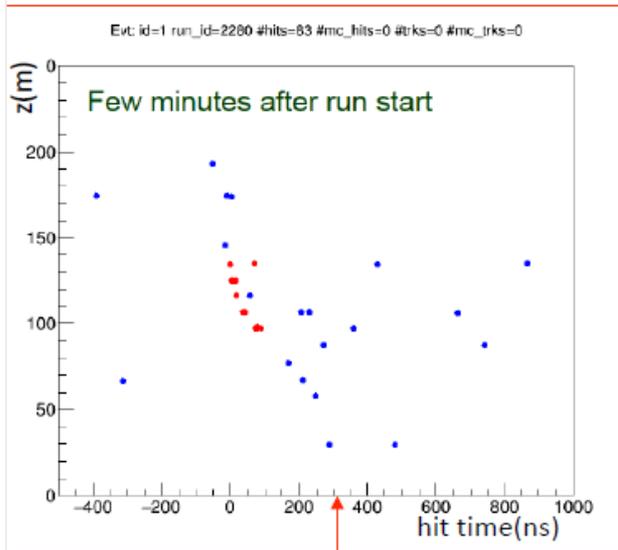

### Optical module

- 31 x 3" PMTs
- Light reflector rings around PMTs
- LED & acoustic piezo inside
- Tiltmeter/compass
- Gbit/s fibre DWDM
- Hybrid White Rabbit
  
- Digital photon counting
- Directional information
- Wide angle of view
- Improved background rejection
- Compact and cost effective design:  
1 DOM equivalent to 3 Antares OMs

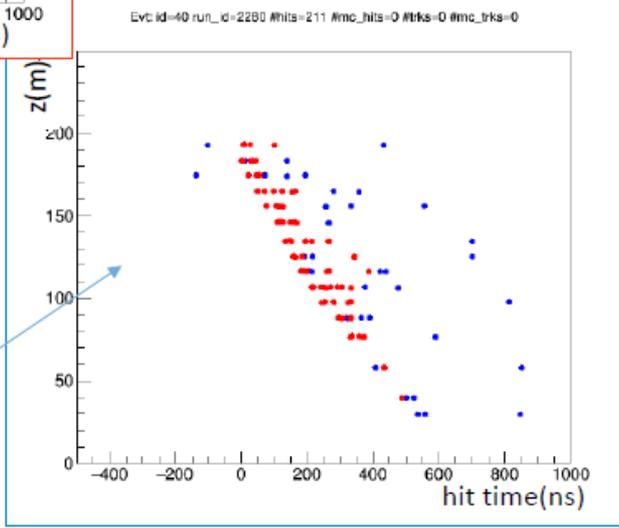

## First ORCA DU preliminary results

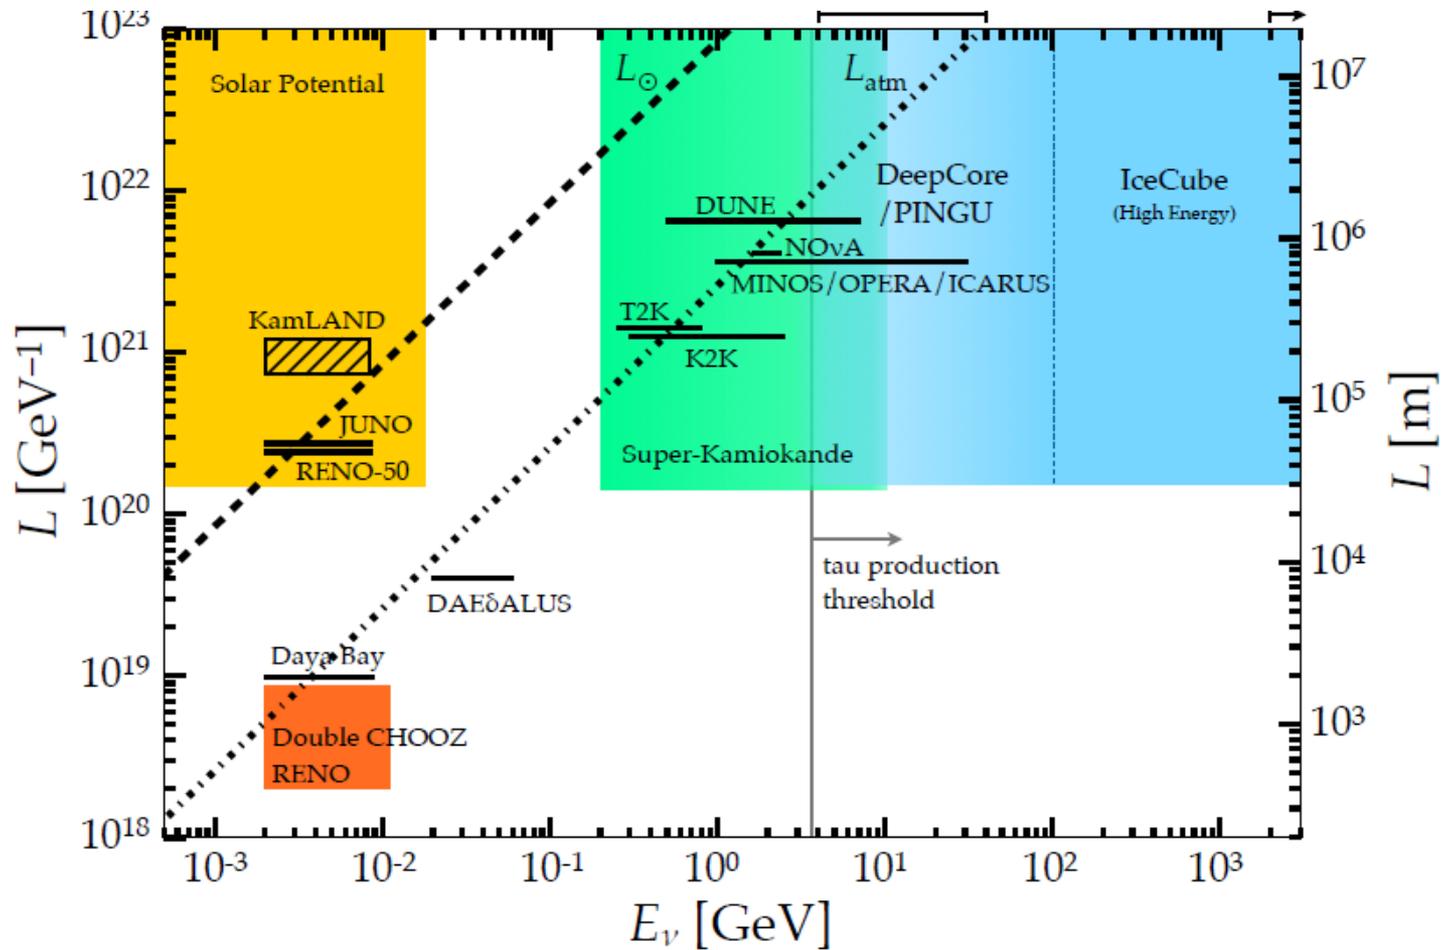

First event with recorded track reconstructed by ORCA (down-going muon)

A bright muon bundle

# IceCube

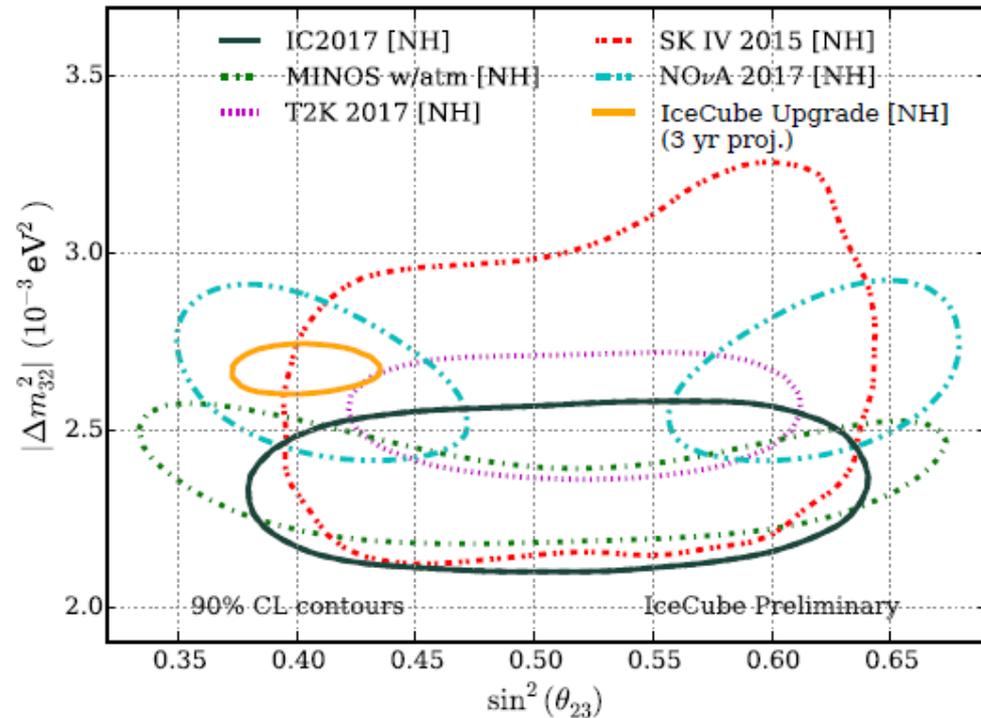

IceCube probes oscillation physics at baselines and energies inaccessible to LBL or reactor neutrino experiments – essential for constraining new physics

# Atmospheric Oscillation Parameters

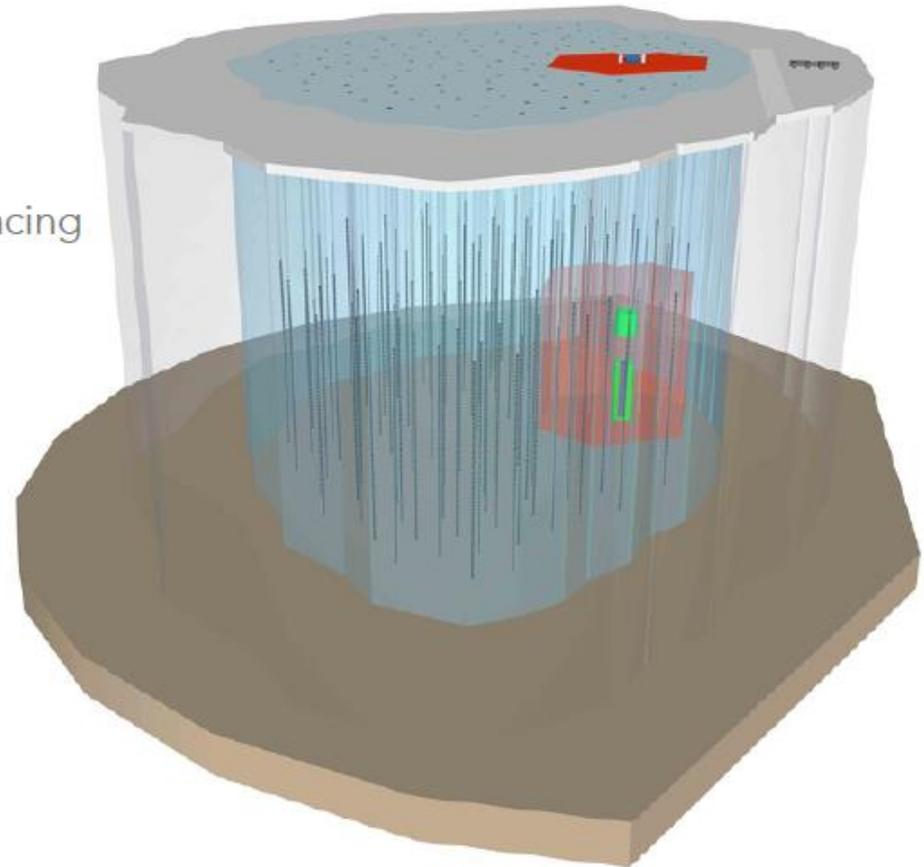

arXiv:1707.07081, *Phys. Rev. Lett.* 120, 071801 (2018)

- Currently unclear whether  $\sin^2 \theta_{23}$  is maximal
  - 3rd mass state made up of equal parts  $\nu_\mu, \nu_\tau$
  - Evidence of new symmetry?
- T2K and IceCube prefer maximal mixing, NO $\nu$ A disfavors maximal at  $2.6\sigma^*$
- Higher energy range of IceCube also permits octant determination via matter resonance (99.93% CL expected at NO $\nu$ A 2017 best fit)

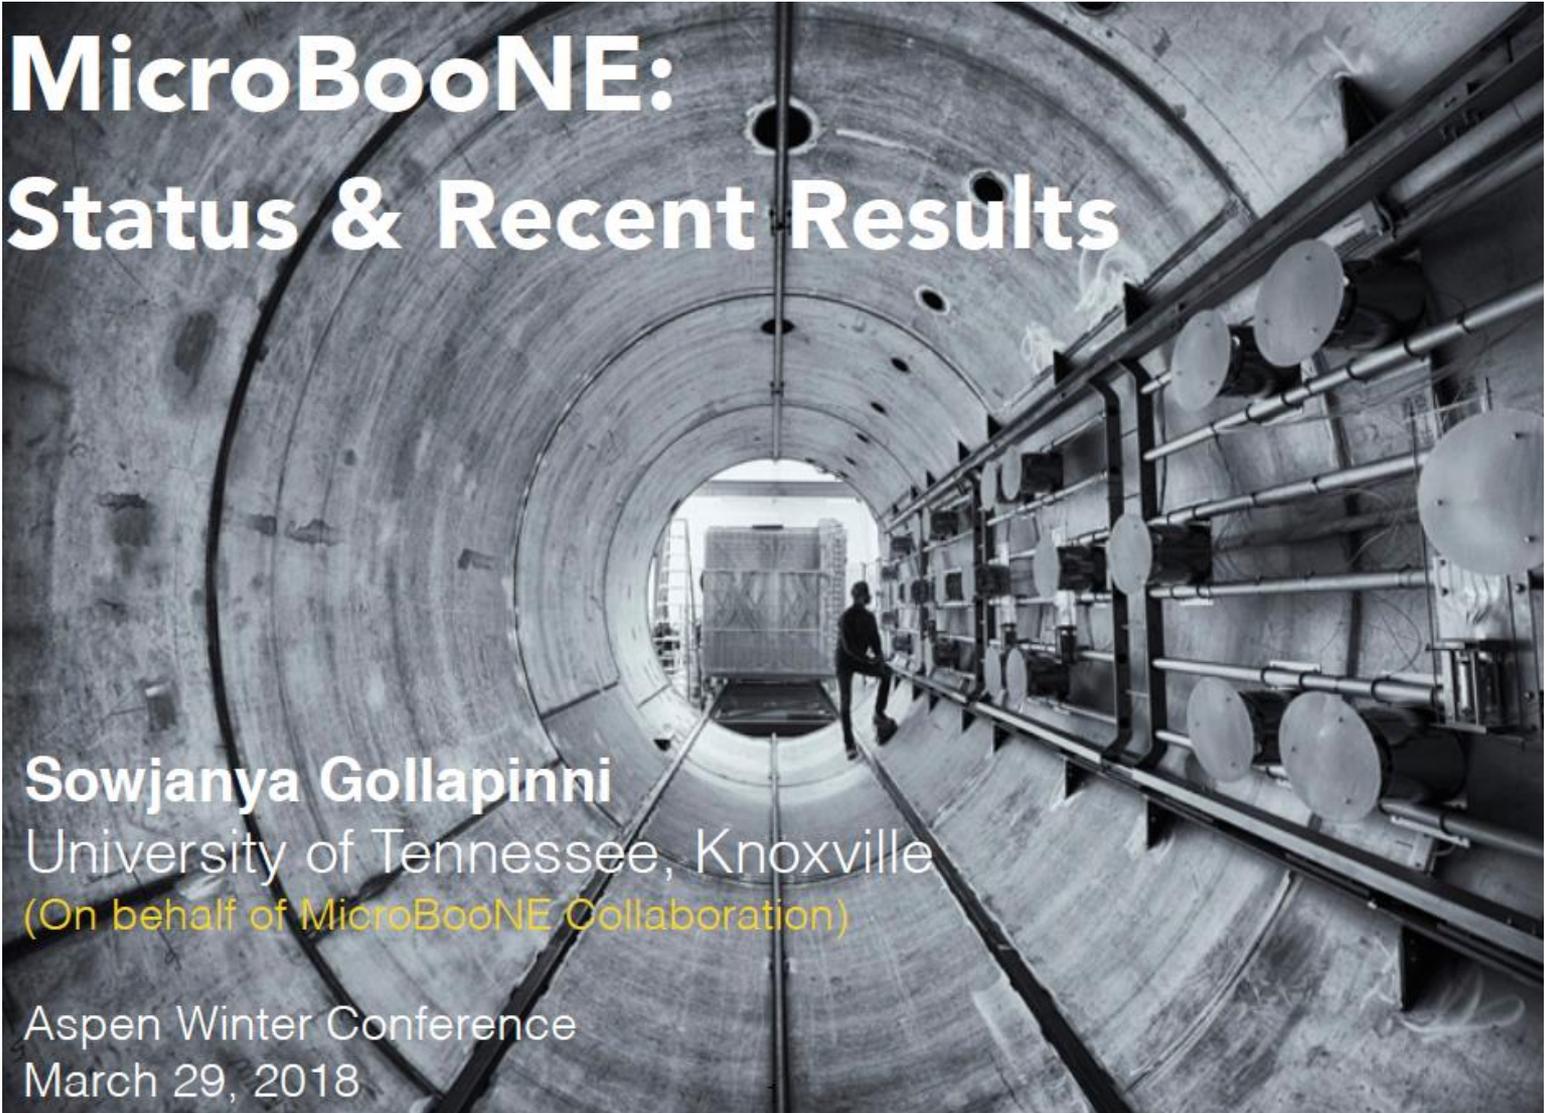

## The Future: IceCube-Gen2

- High Energy Array
  - 120 strings x 80 sensors/string
  - $\sim 8 \text{ km}^3$  volume, wider string spacing
- PINGU
  - Low energy infill
  - 26 strings (incl. IC Upgrade)
- Also investigating surface arrays, UHE radio detection
- Cost scale similar to IceCube

## MicroBooNE: Status & Recent Results

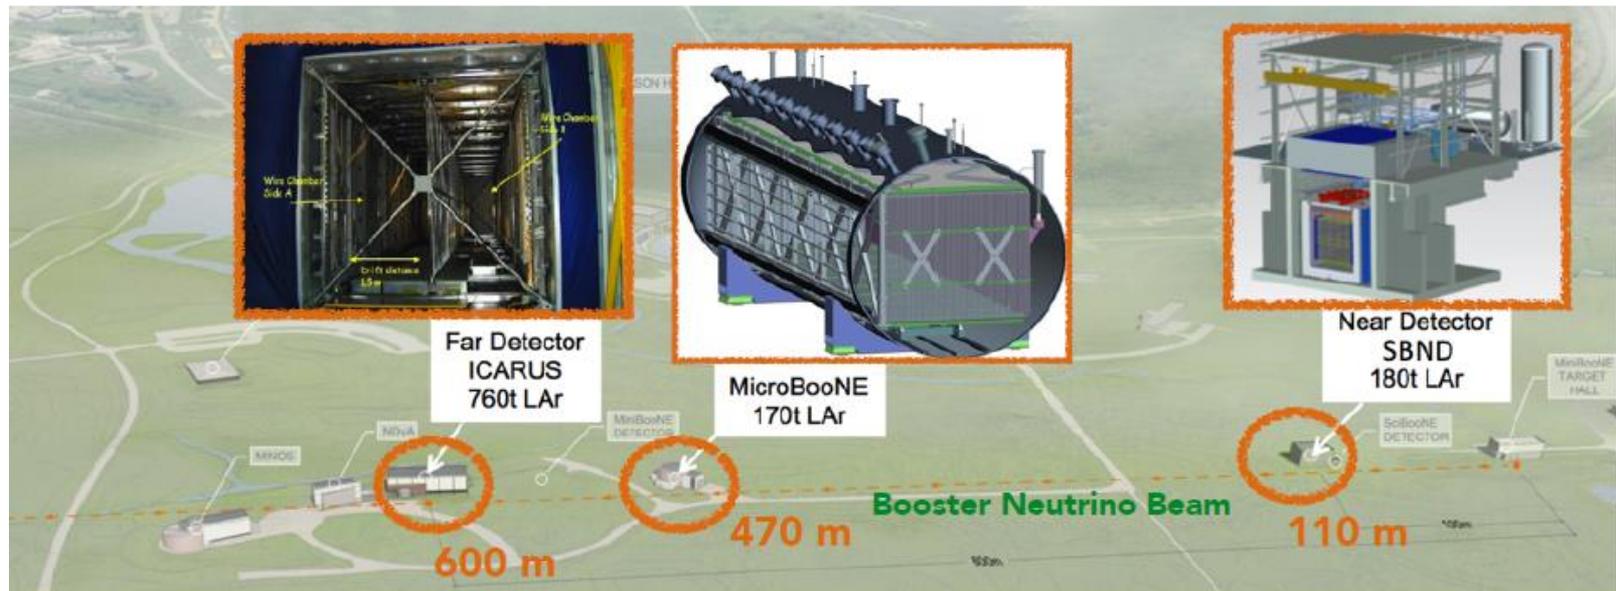

**Sowjanya Gollapinni**

University of Tennessee, Knoxville  
(On behalf of MicroBooNE Collaboration)

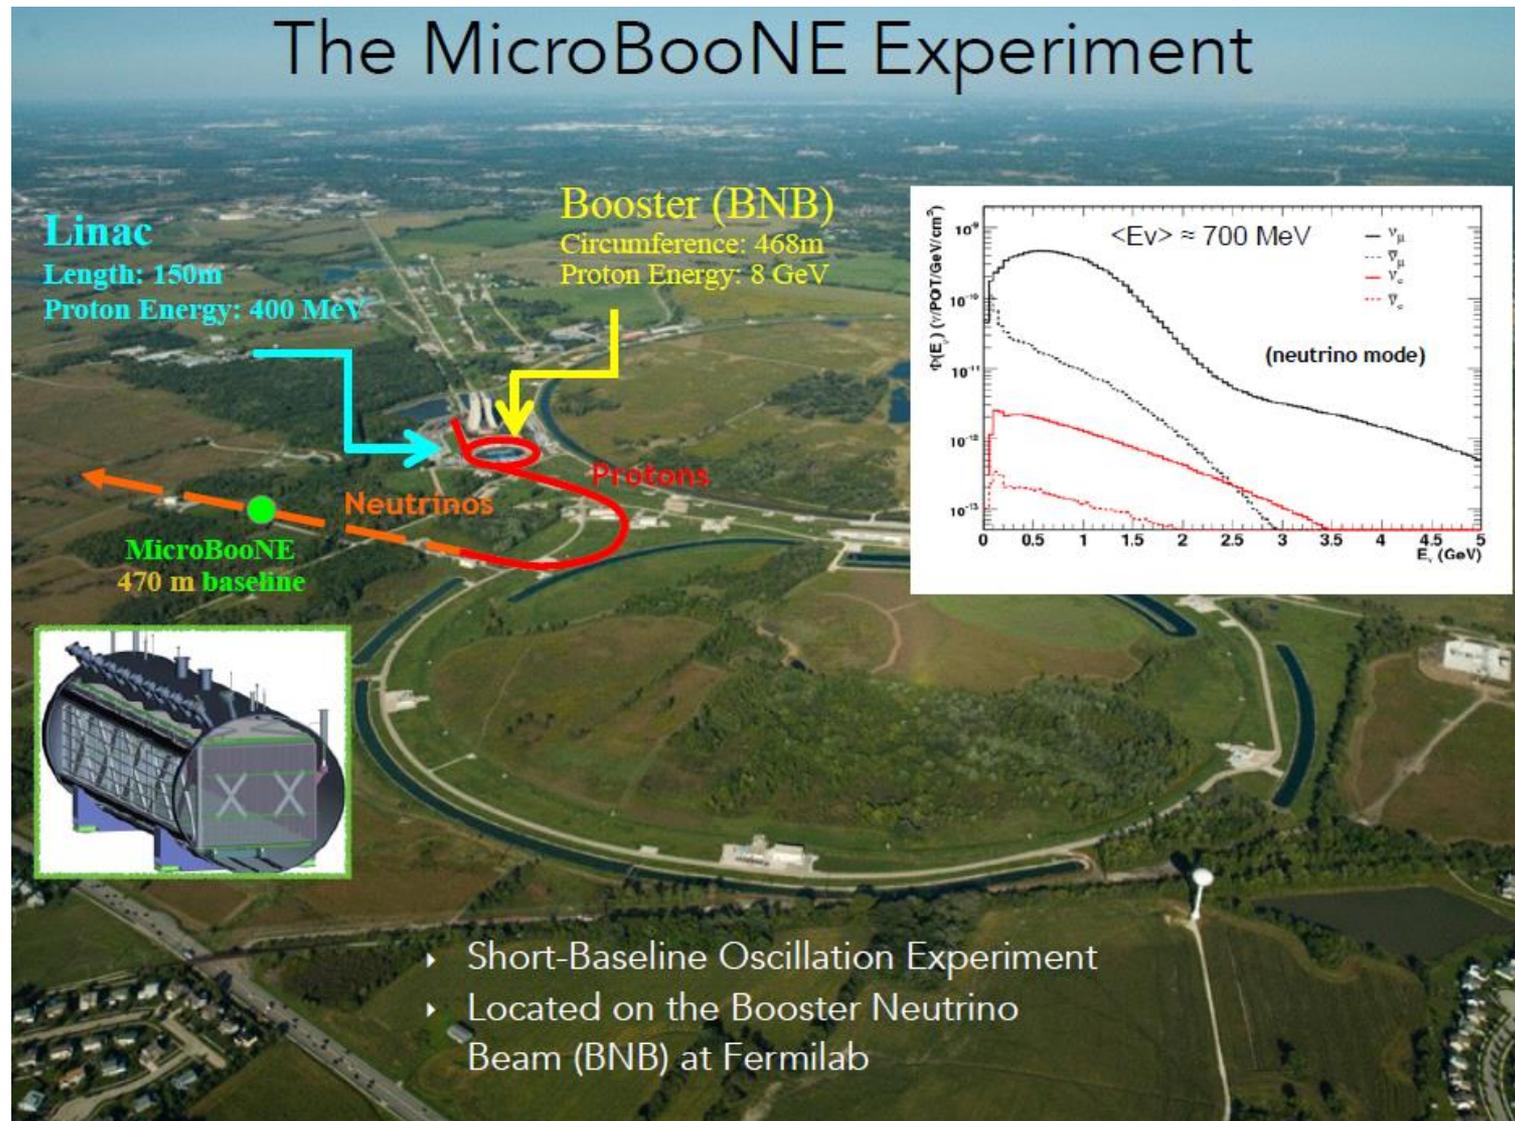

Aspen Winter Conference  
March 29, 2018

## The Short-Baseline Neutrino Program

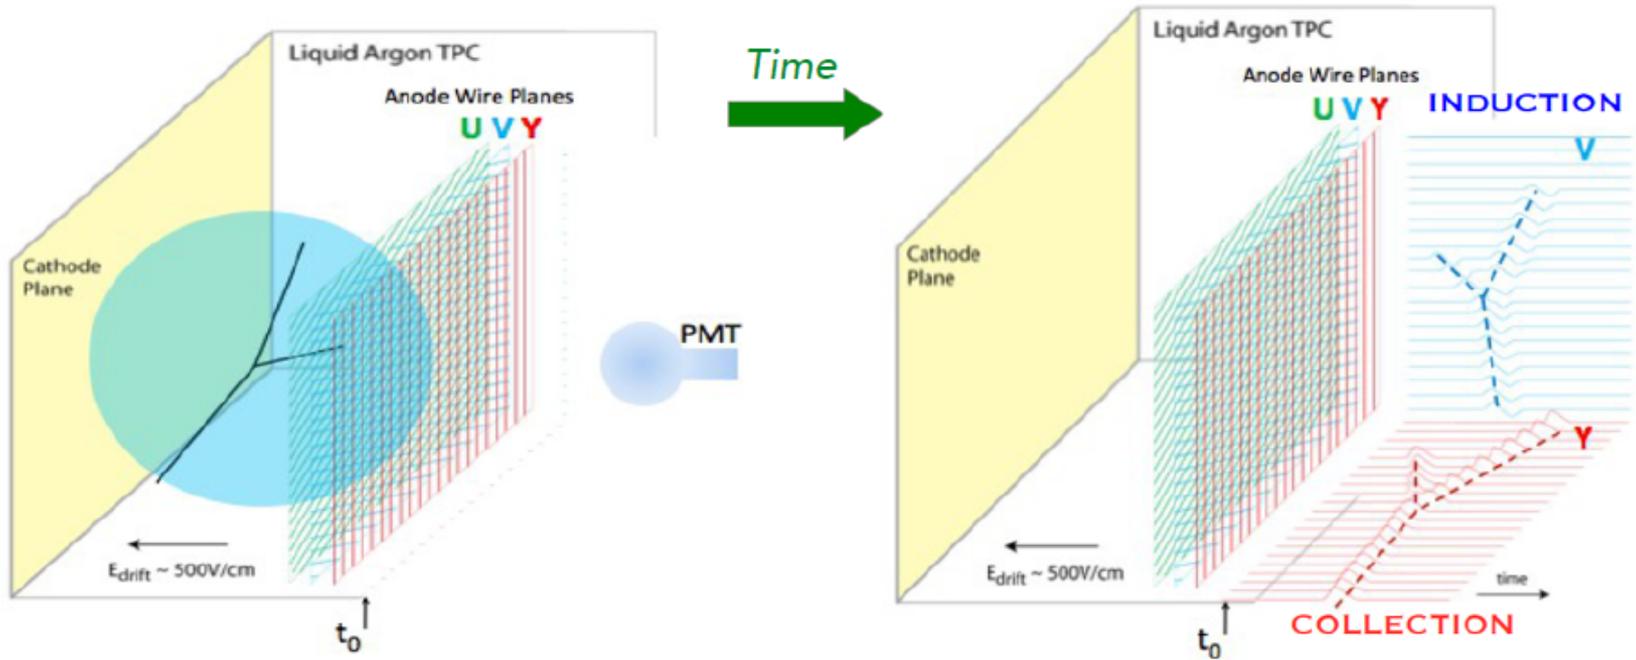

- MicroBooNE is paving way for the three-detector SBN program to more definitively address the sterile neutrino question where we have existing hints
  - Well understood BNB beam
  - Same detector technologies, same beam = reduced systematics!

## The MicroBooNE Experiment

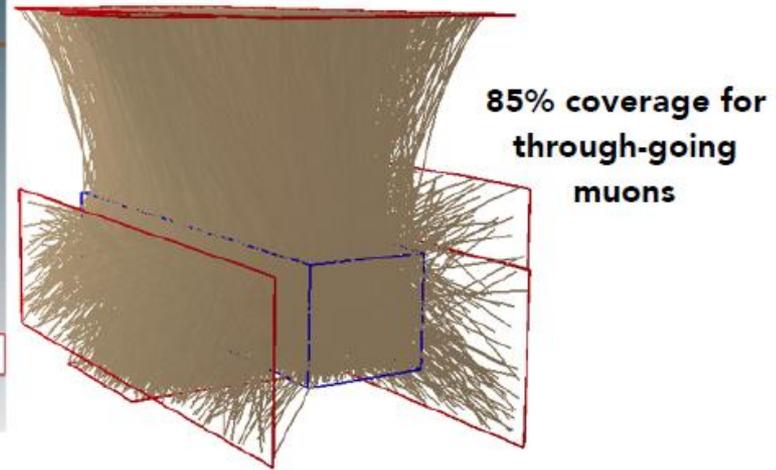

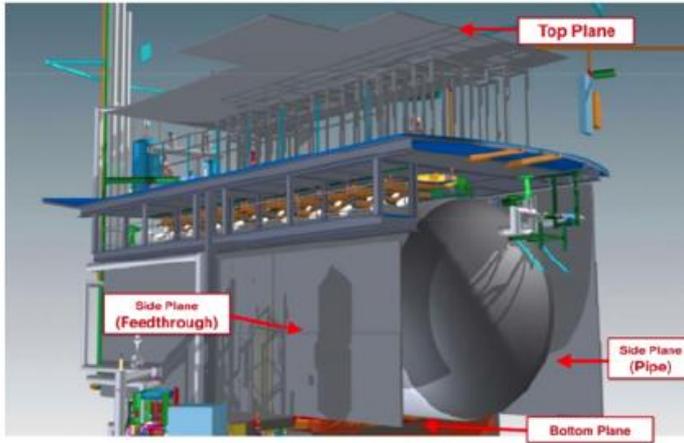

## The LArTPC Principle

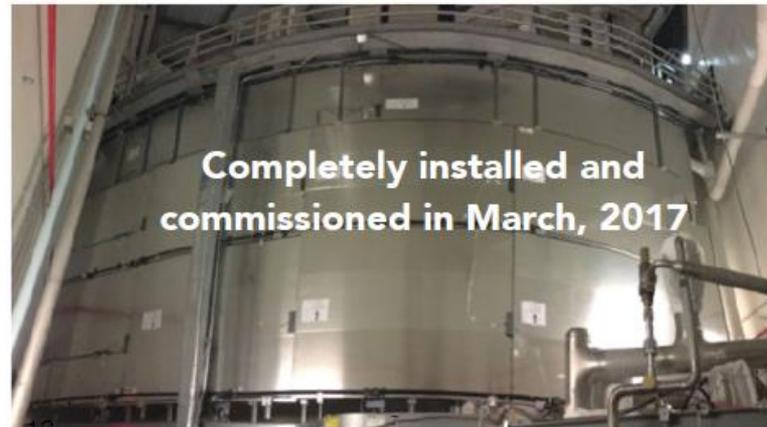

- Argon makes a desirable target (dense, abundant,...)
- Two signals: Ionization signal & Scintillation light
- Finely (mm-scale) segmented anode wires — excellent resolution!
- Bubble chamber quality images in HD!
- Technology allows for scalability — can build massive detectors

**Wire Planes + Signal  
Arrival Time  
= 3D Image**

## Upgrades: Cosmic Ray Tagger System

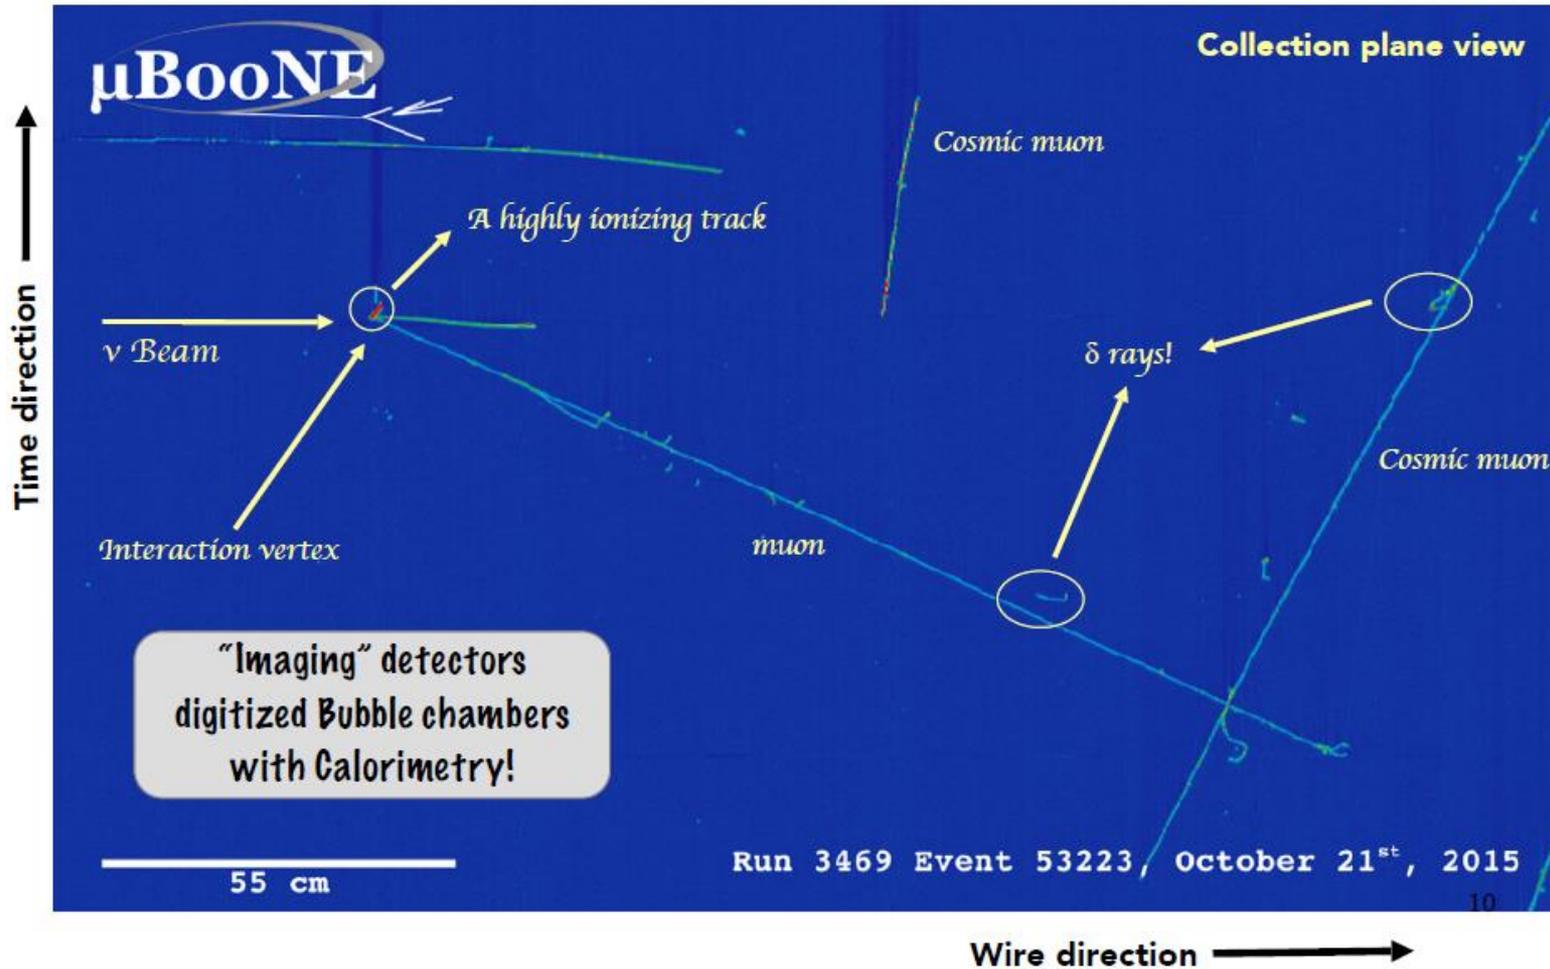

- Plastic Scintillator Modules & SiPM readout
- Design & Construction paper under preparation for JINST
- Currently developing matching techniques between TPC and CRT

Developing multiple approaches for the flagship oscillation analysis

# FLAVOUR

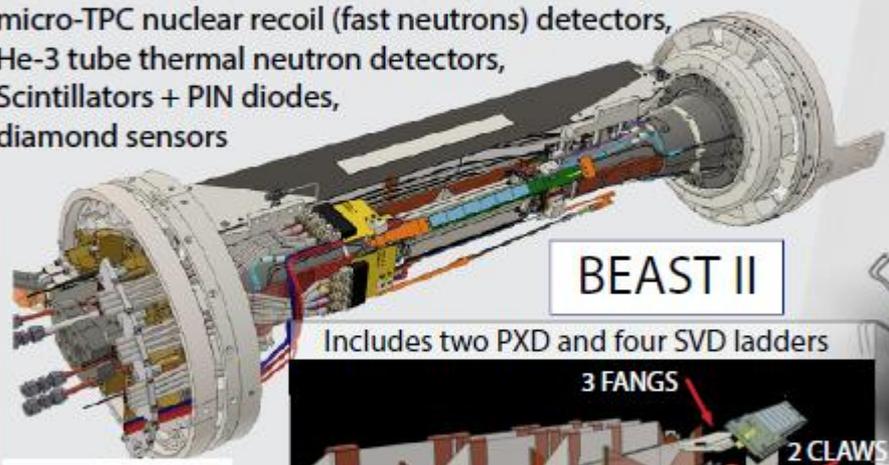

## BEAST II (Phase 2 Commissioning Detector inside Belle II)

A system of radiation detectors: beam background monitors, first responders

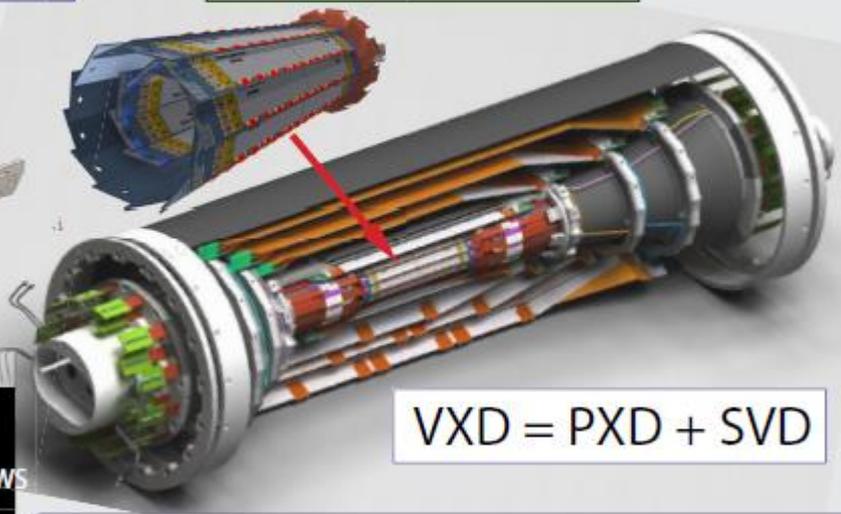

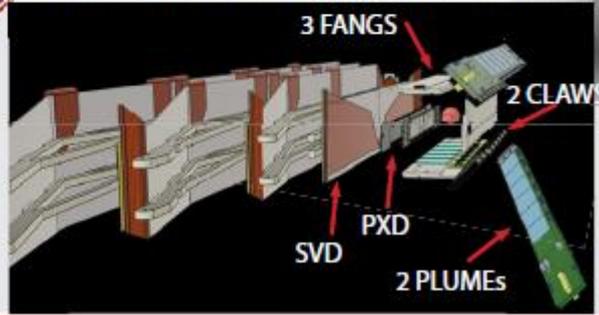

FANGS: "LHC/ATLAS style" silicon pixel sensors,  
CLAWS: scintillator tiles read-out by silicon PMTs,  
PLUME: "ILC style" MIMOSA silicon pixel sensors,  
micro-TPC nuclear recoil (fast neutrons) detectors,  
He-3 tube thermal neutron detectors,  
Scintillators + PIN diodes,  
diamond sensors

Now → End of 2018

BEAST II

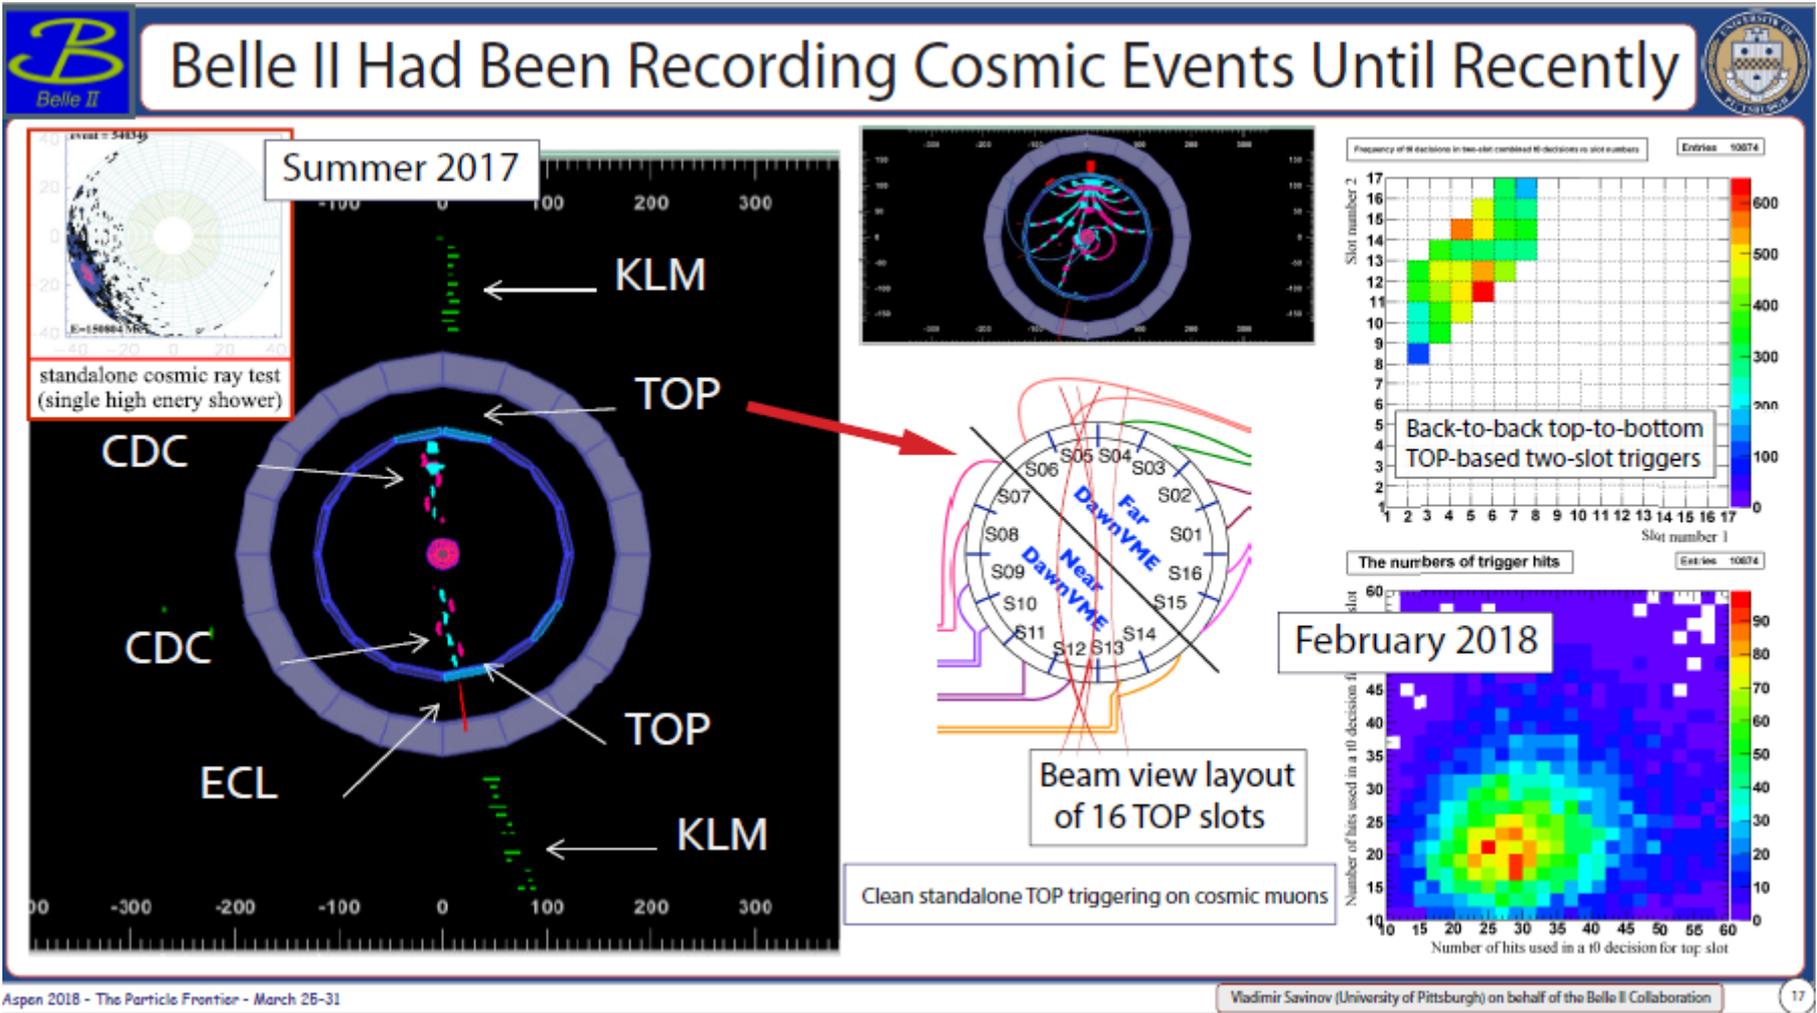

Includes two PXD and four SVD ladders

VXD = PXD + SVD

Understanding beam-related backgrounds (and physics backgrounds!) is of great importance  
There is only that much of radiation hardness...

# Belle II

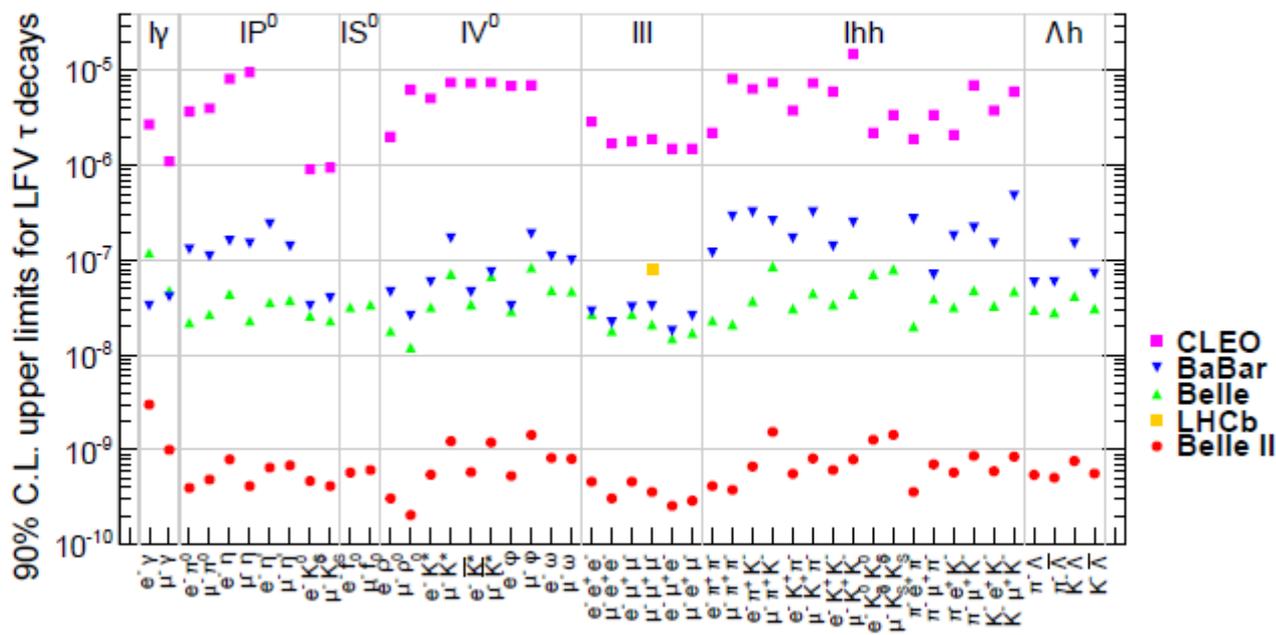

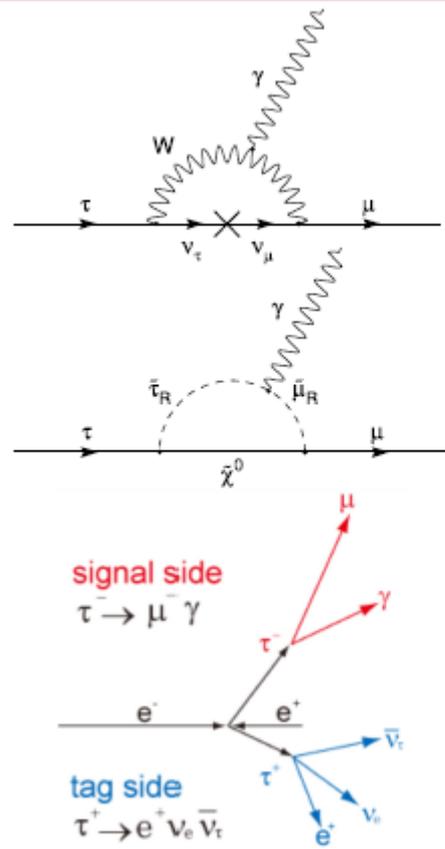

## $\tau$ Leptons Provide a Unique Laboratory to Search for LFV

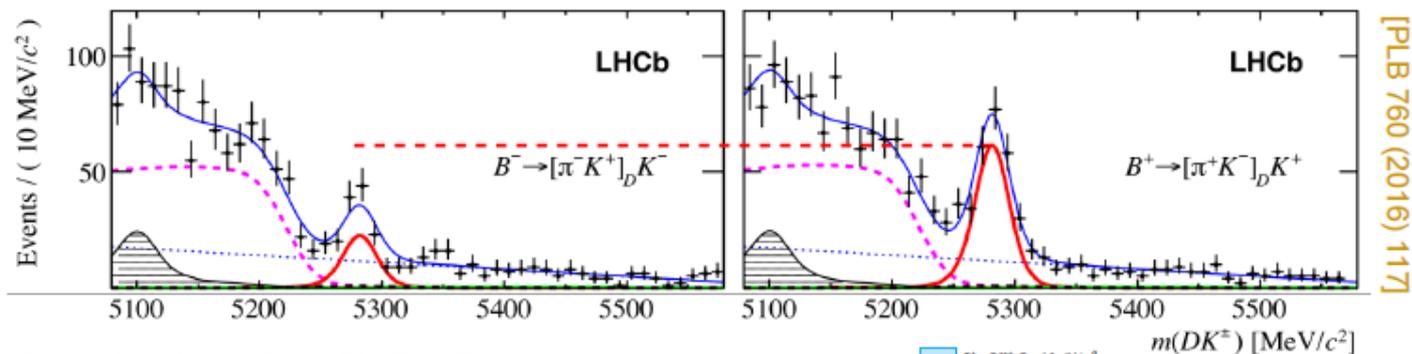

Upper limits for LFV  $\tau$  decays with the full  $50 \text{ ab}^{-1}$  data sample at Belle II

B2TiP report / to be submitted to PTEP (2018)

## CP violation - $\gamma$

Almost all the best channels for the determination of the CKM angle  $\gamma$  have now been analysed for run 1. For example, suppressed 'ADS' mode,  $B^- \rightarrow (\pi^- K^+) D K^-$  (+CC)

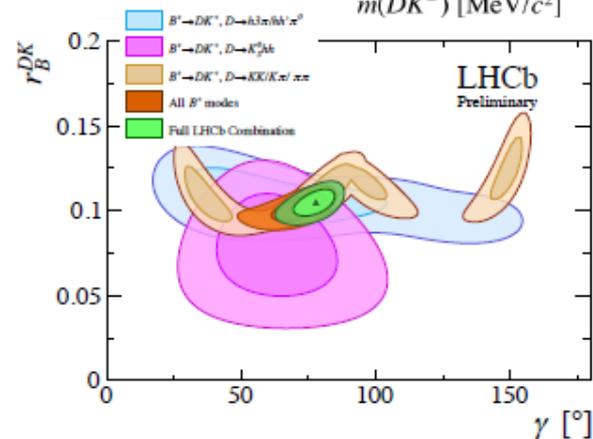

Combination of LHCb  $B \rightarrow DK$  results obtained so far

LHCb-CONF-2017-004  $\gamma = (76.8^{+5.1}_{-5.7})^\circ$

Uncertainty significantly better than that obtained with combined B-factory results.

Agrees with prediction from rest of triangle

$$\gamma^{\text{indirect}} = (65.3^{+1.0}_{-2.5})^\circ$$

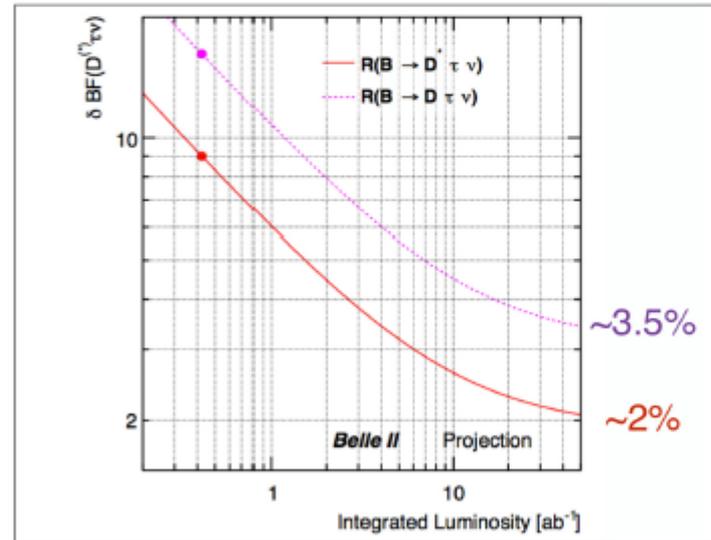

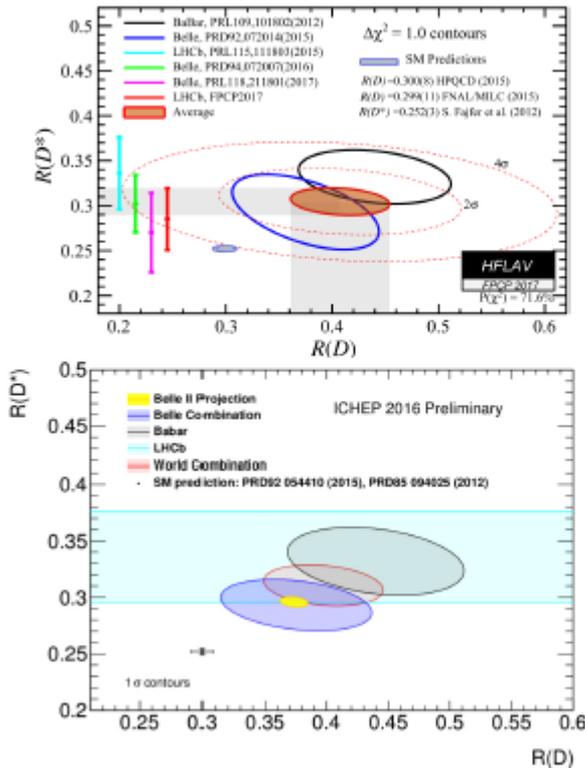

## Flavor Anomaly in $R(D)$ and $R(D^*)$

$$\mathcal{R}(D^{(*)}) = \frac{\mathcal{B}(\bar{B} \rightarrow D^{(*)} \tau^- \bar{\nu}_\tau)}{\mathcal{B}(\bar{B} \rightarrow D^{(*)} \ell^- \bar{\nu}_\ell)} \quad (\ell = e, \mu)$$

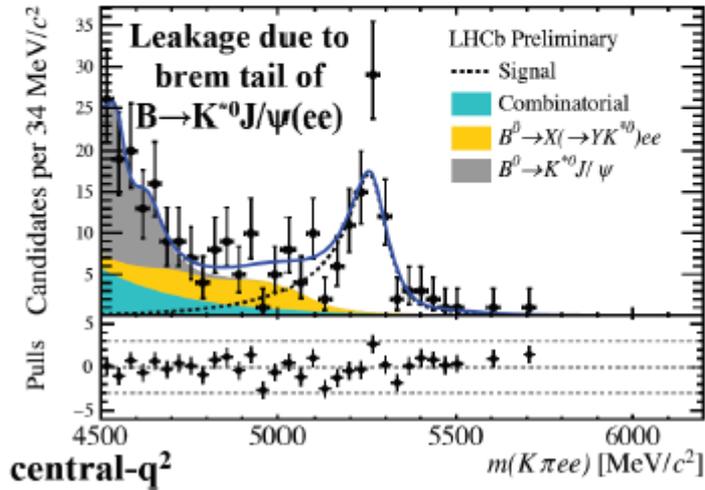

[ $\tau$  helicity provides a handle to investigate the new (virtual) particle (if confirmed)]

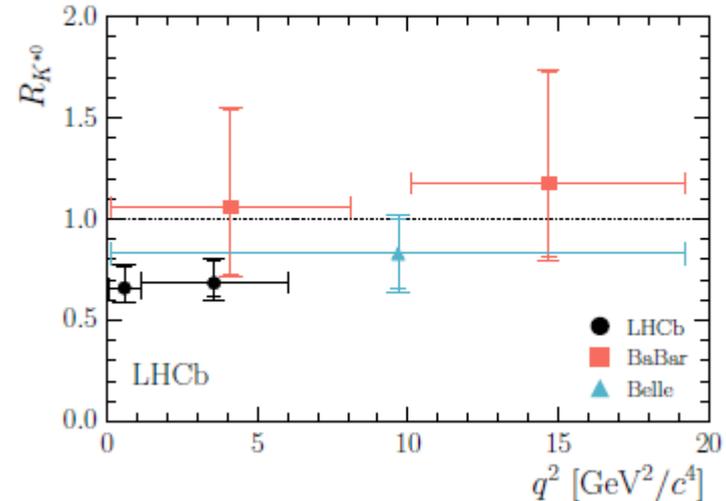

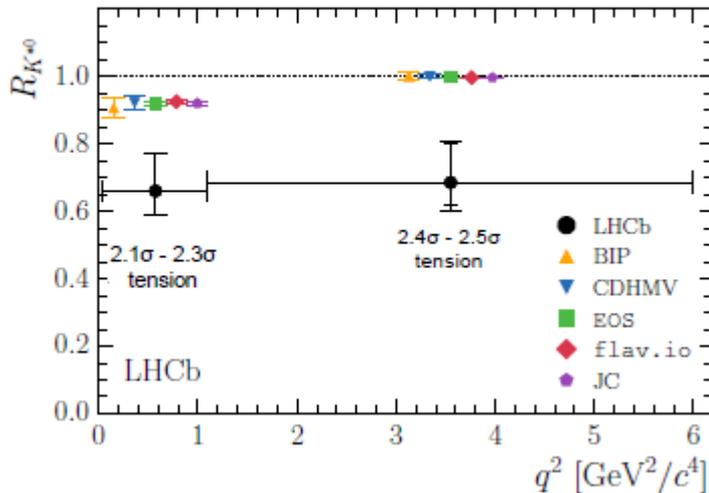

If the current  $4.1\sigma$  deviation is real, Belle II should be able to make a discovery with  $5/\text{ab}$  (i.e. around 2021)

## $R(K^*)$

JHEP 08 (2017) 055

	low- $q^2$	central- $q^2$
$R_{K^{*0}}$	$0.66 \pm_{-0.07}^{+0.11} \pm 0.03$	$0.69 \pm_{-0.07}^{+0.11} \pm 0.05$
95.4% CL	[0.52, 0.89]	[0.53, 0.94]
99.7% CL	[0.45, 1.04]	[0.46, 1.10]

# GRAVITATIONAL WAVES

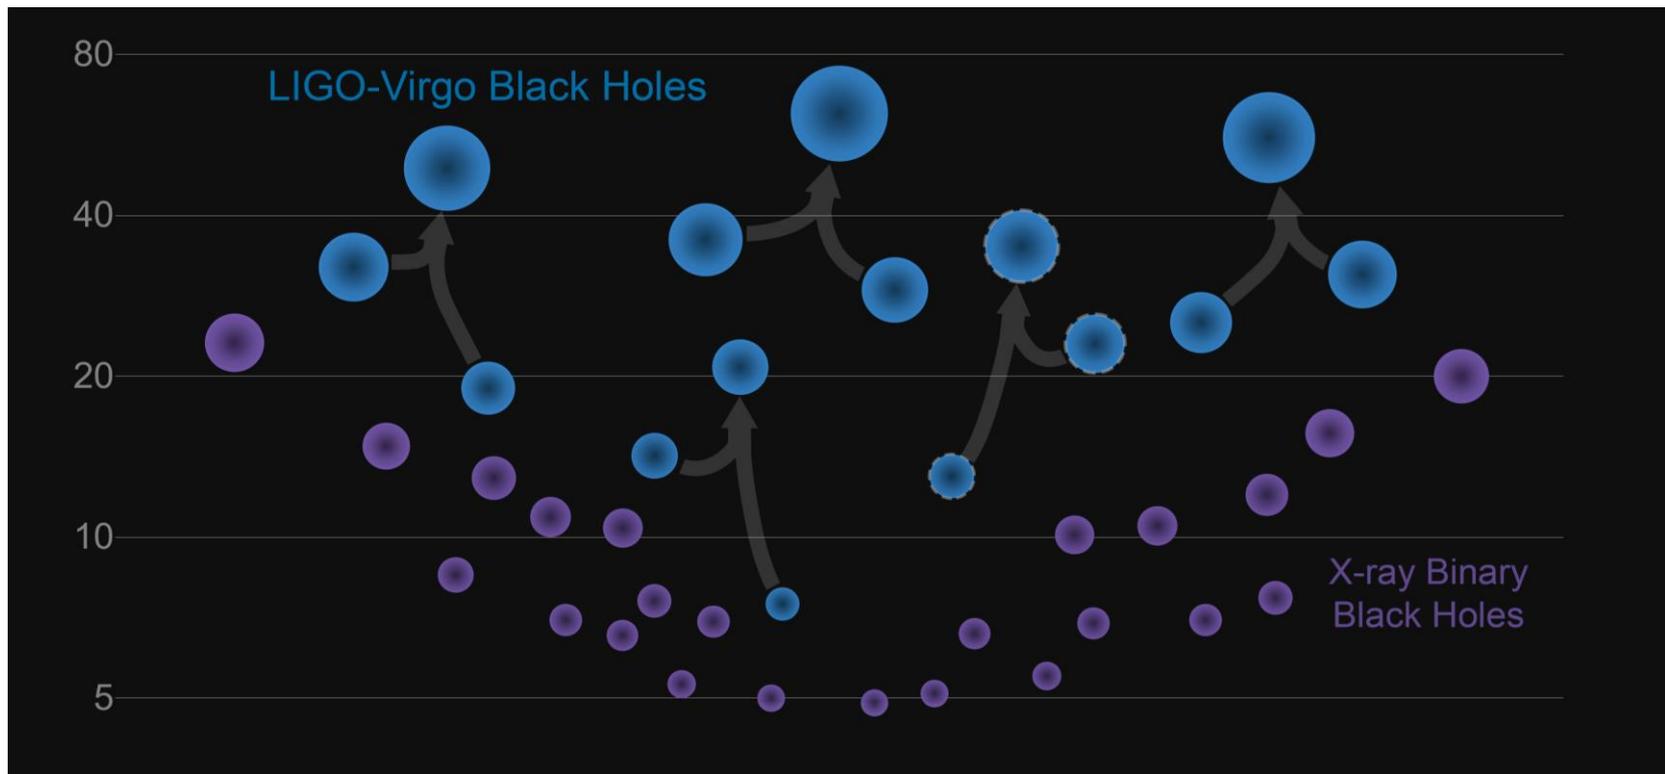

# Ground based detectors

- Initial observatories, and instruments, constructed starting in mid-90's
  - **NSF Physics** for LIGO; **Virgo's support from CNRS and INFN**
- Observed, setting upper limits until 2011
- Both Virgo and LIGO undertook a complete rework of the instruments
- Advanced LIGO came on line in 2015 – First discovery 15 Sept 2015
- Advanced Virgo came on line in 2017 – First signal 14 August 2017

# Stellar-mass Binary Black Holes

- 5 events published to date; 1 with both LIGO and Virgo detectors
- Consistency with GR in extremes of compactness and  $v/c \sim 0.6$
- Revealed an unexpected class of heavier Stellar-mass BH

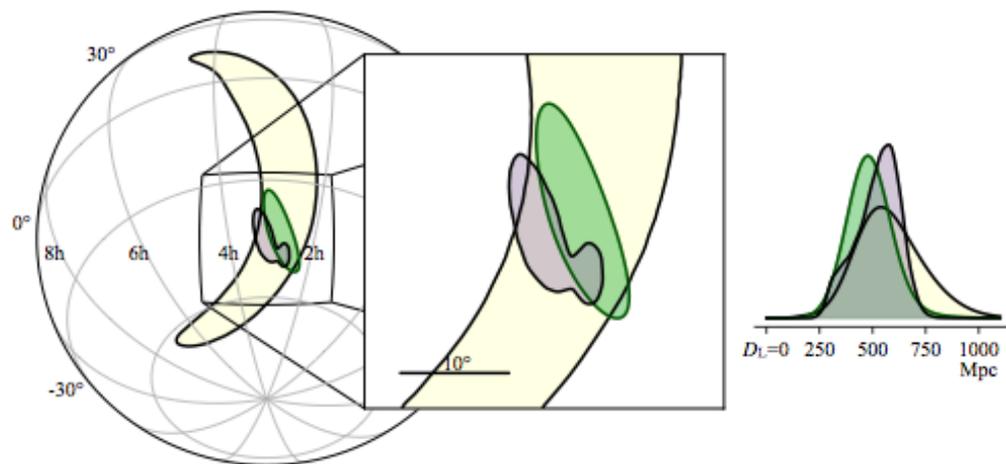

# LIGO + VIRGO

GW170814: Virgo **and** LIGO detectors, enabling triangulation, polarization sensing

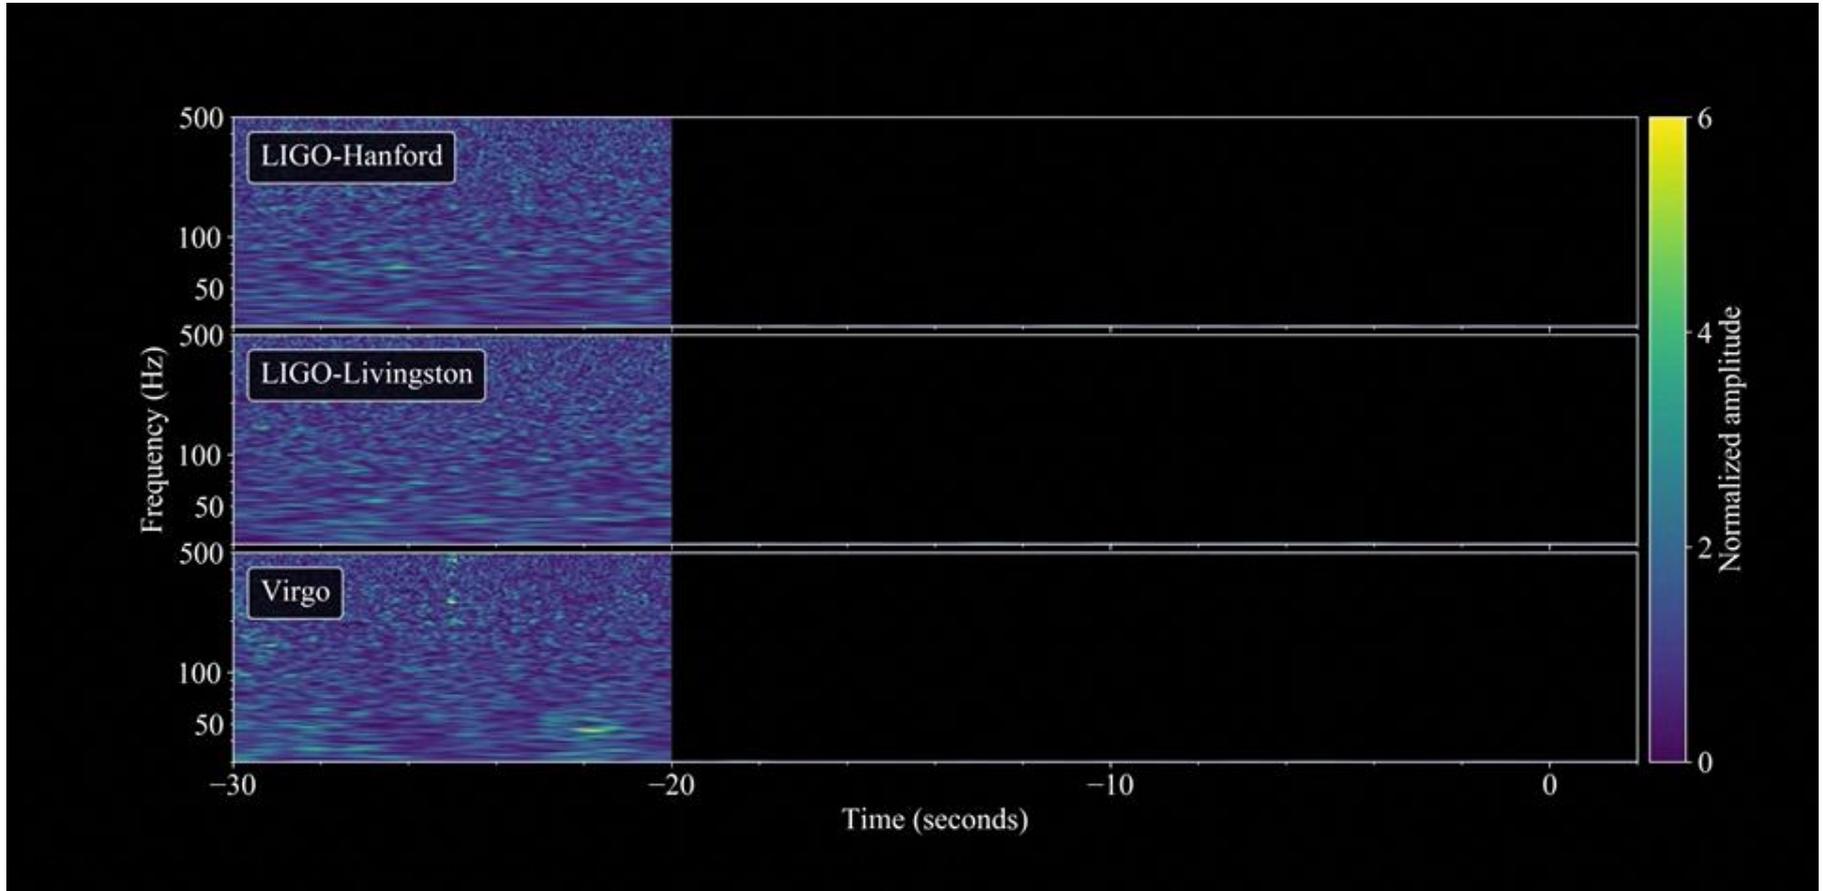

LIGO-Hanford and Livingston have similar orientations -> little information about GW polarizations

Virgo is not aligned with LIGO – giving polarization information

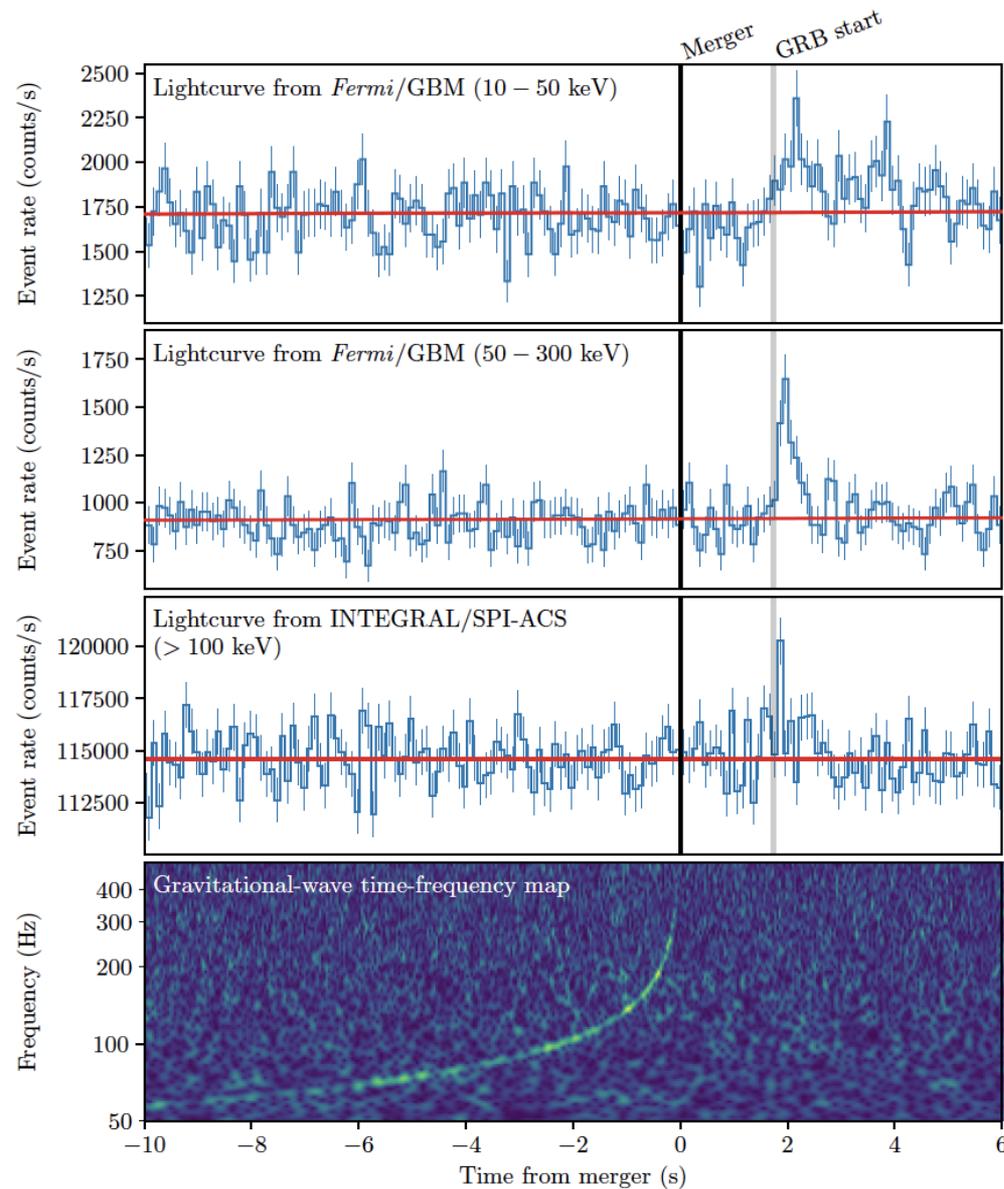

Sky localization improves ~20x; Uncertainty in volume reduced ~34x

# GW170817: Binary Neutron Star Coalescence

# GRB 170817A

GRB 170817A occurs  $(1.74 \pm 0.05)$  seconds after GW170817

It was autonomously detected in-orbit by *Fermi*-GBM (GCN was issued 14s after GRB) and in the routine untargeted search for short transients by INTEGRAL SPI-ACS

Probability that GW170817 and GRB 170817A occurred this close in time and with location agreement by chance is  $5.0 \times 10^{-8}$  (Gaussian equivalent significance of  $5.3\sigma$ )

-> BNS mergers are progenitors of (at least some) SGRBs

# Multimessenger Observations

## Approximate timeline:

GW170817 - August 17,  
2017 12:41:04 UTC =  $t_0$

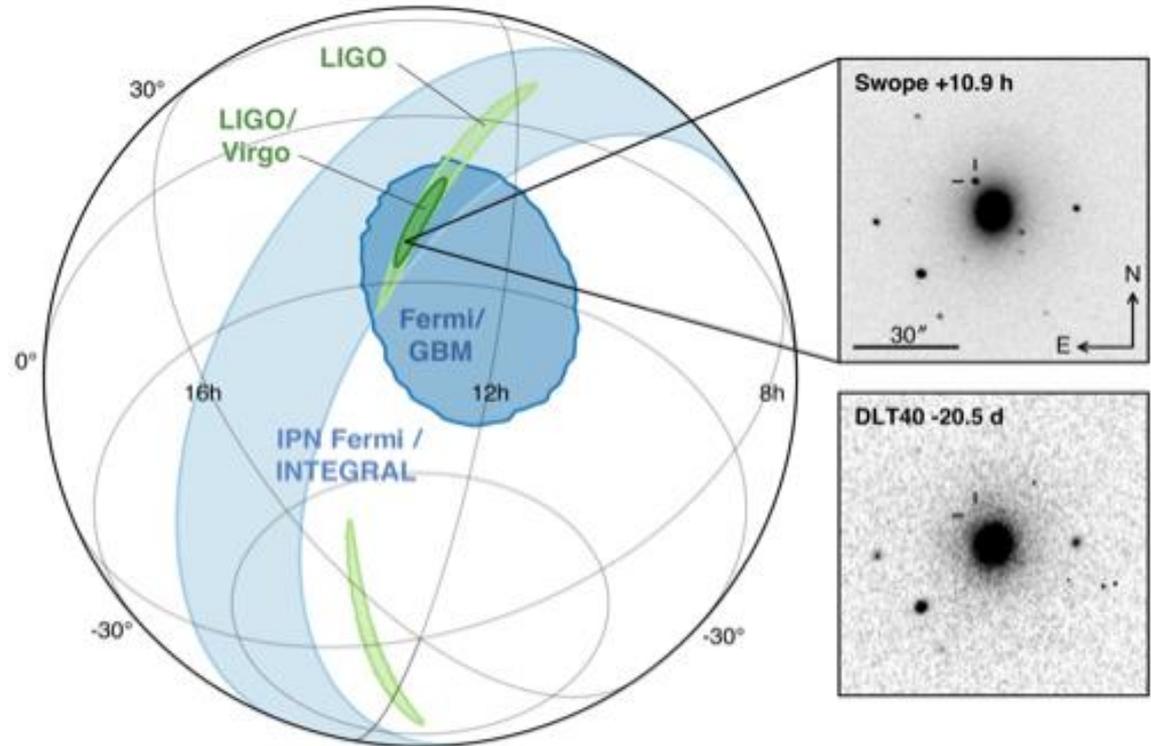

GRB 170817A  
 $t_0 + 2$  sec

LIGO signal found  
 $t_0 + 6$  minutes

LIGO-Virgo GCN reporting  
BNS signal associated  
with the time of the GRB  
 $t_0 + 41$  minutes

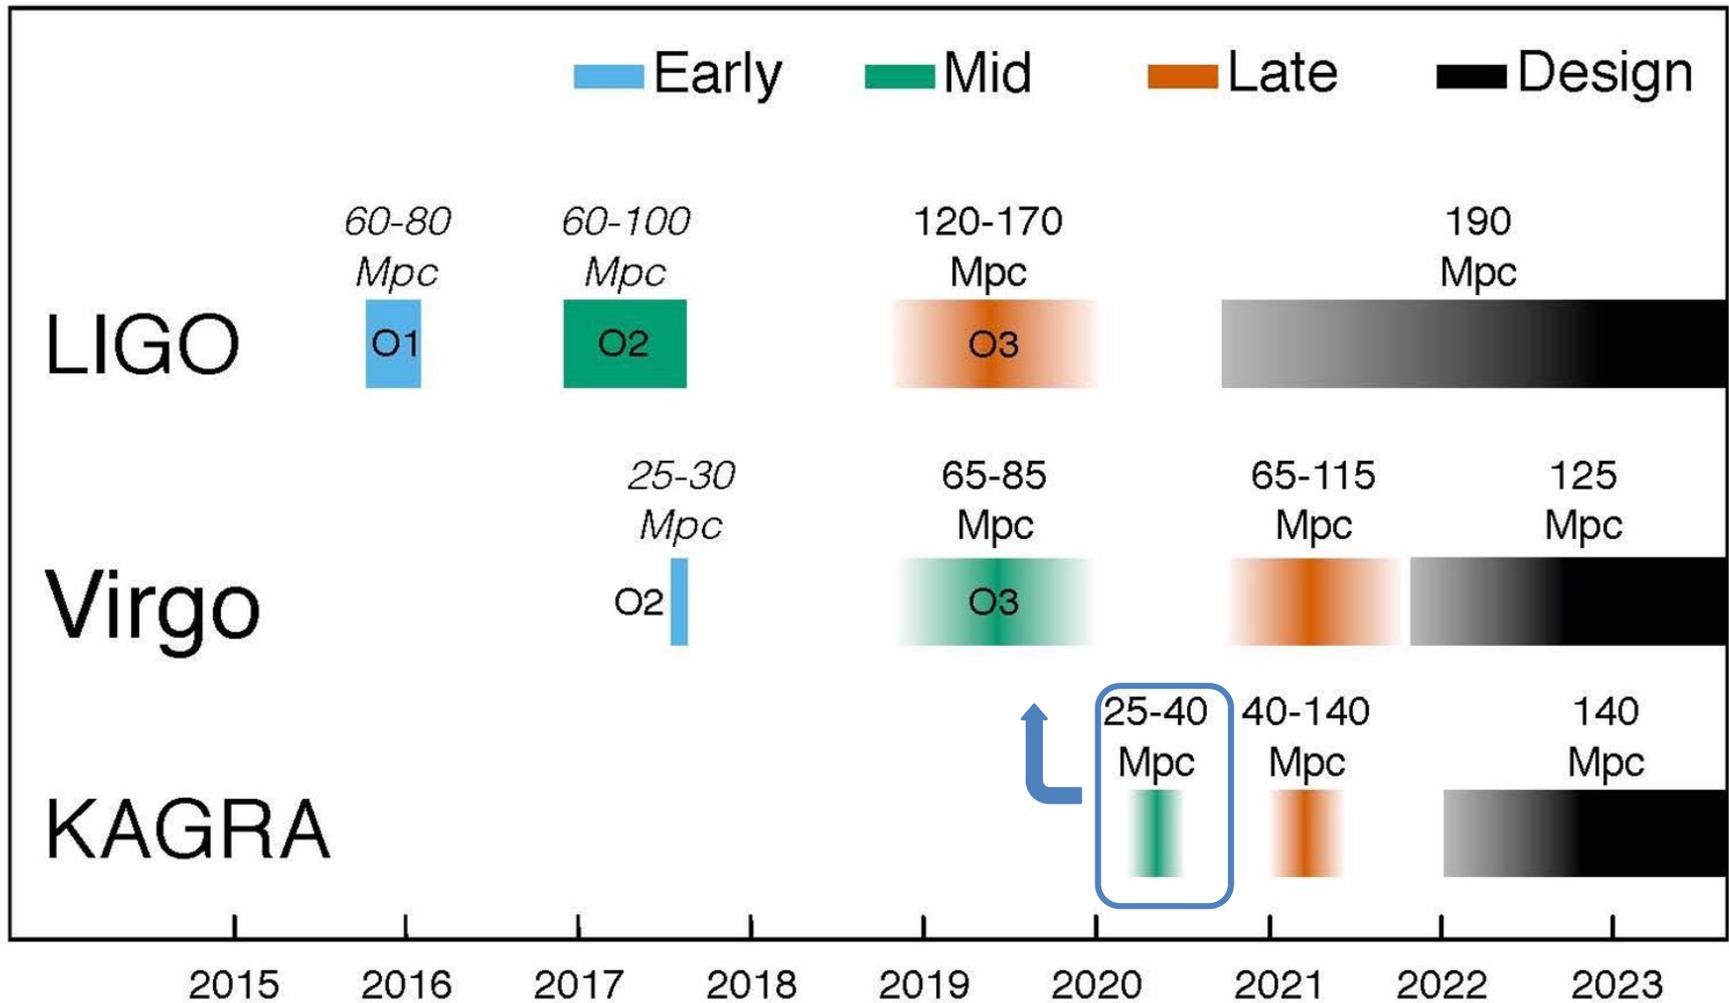

SkyMap from LIGO-Virgo  
 $t_0 + 4$  hours

Optical counterpart found  
 $t_0 + 11$  hours

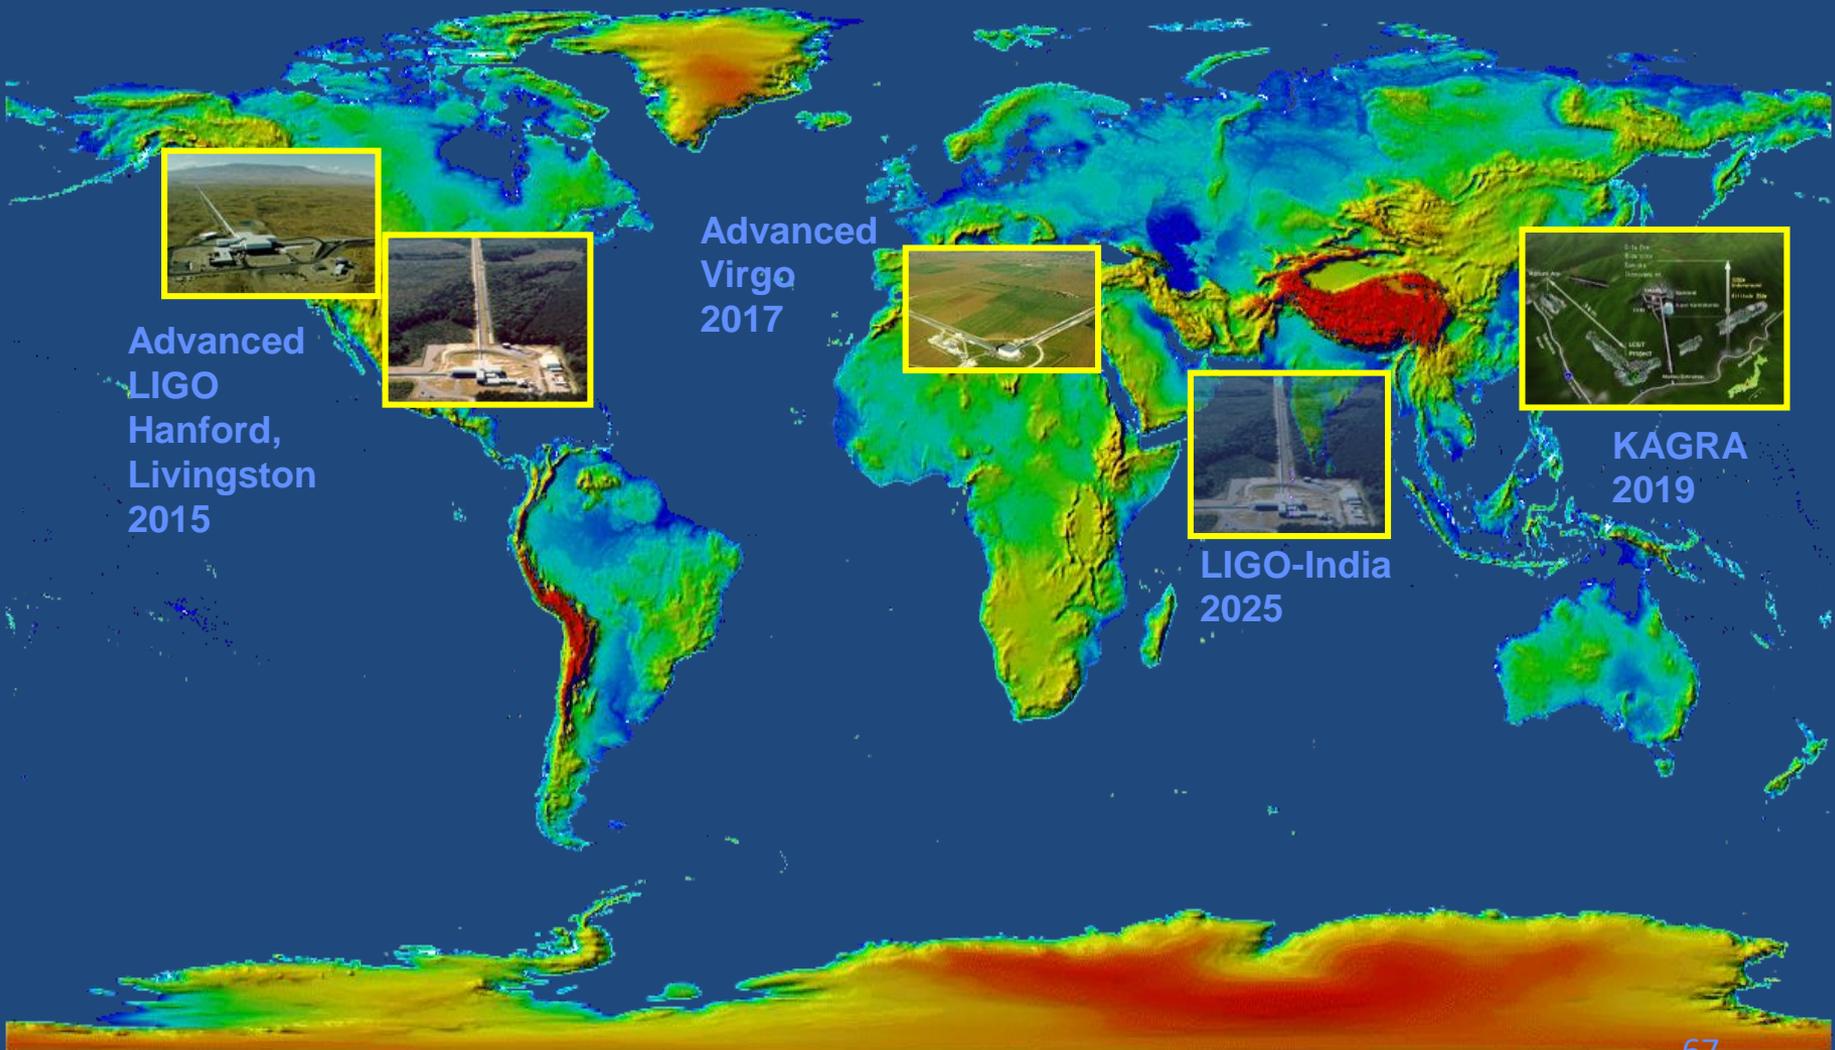

- The localisation region became observable to telescopes in Chile 10 hours after the event time (wait for nightfall!)
- Approximately 70 ground- and space- based observatories followed-up on this event
- **And...: transmutation of common elements (pure neutron matter) into gold!**
